

Note: choose the correct answer:

(2 marks for each right answer)

1-In skeletal muscle the tissue that bounds together a group of fascicles is a(an): -

- A- epithelial tissues B- nervous tissue C- muscle tissue D- connective tissue

2-In the axial skeleton, the red bone marrow is found in the:-

- A- scapula B- clavicle C- sternum D- both (B and C) are correct

3-Which of the following is a function of the long bone:

- A- its ability to contract and relax enables the body to move
C- helps the body to maintain a constant temperature
B- produces platelets
D- all of them are correct

4- The adjacent figure shows which of the following?

- A- a Haversian canal that is surrounded by lamellae in compact bone.

B- a spongy bone that has a latticework structure.

C- a periosteum that contains a network of blood vessels.

D- a long bone cavity that contains the yellow bone marrow.

5-Epiphyseal plate is **NOT** found at the ends of immature: -

- A- fibula bone B- skull bones C- humerus bone D- tibia bone

6-The smooth muscle differs from the skeletal muscle in that the smooth muscle: -

- A- has origin and insertion points B- is striated C- forms the walls of the internal organs D- is voluntary

7-Which of the following is **incorrect** for a relaxed muscle?

- A- the length of the actin and the myosin filaments does not change in comparison to a contracted muscle
B- the actin and myosin filaments overlap
C- the actin and myosin filaments slide past each other
D- all of them are incorrect.

8-The cardiovascular system differs from the lymphatic system in that the cardiovascular system:

- A- is a part of the circulatory system
B- contains red blood cells
C- its vessels are one-way that transport the fluid it contains from the tissues to the heart
D- contains lymphocytes

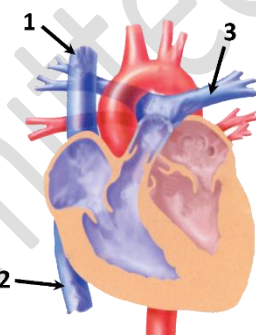

9-Which of the following is correct about red blood cells?

- A- immature red blood cells synthesize large amounts of hemoglobin
B- their cell nucleus and organelles disintegrate
C- they form antibodies
D- both (A and B) are correct

10-Depending on the adjacent figure, all blood vessels

that are labeled by numbers 1, 2, 3: -

- A- are veins
B- carry deoxygenated blood to the heart
C- their walls are made up of three layers
D- both (A and C) are correct

11-Which of the following is **incorrect**?

(1- Only artery carries oxygenated blood, 2- The artery and the vein both have an inner layer of endothelial tissue, 3- The artery divides into smaller blood vessels until they end in capillaries, 4- Only vein carries deoxygenated blood).

- A- 1, 3, 4 B- 1, 4 C- 1, 2, 4 D- 2, 3, 4

12-In this blood transfusion process $AB^+ \rightarrow O^-$:-

(1- anti-Rh antibodies will react with Rh antigens ,2- anti-A antibodies will react with A antigens, 3- anti-B antibodies will react with B antigens)

- A- 1, 2 B- 1, 2, 3, C- 1, 3 D- 2, 3

13-Which of the following are the characteristics of the atrioventricular node?

(1- It is located in the septum between the two ventricles, 2- it relays the electrical impulse to the muscle cells that make up the ventricles, 3- it regulates the rate of contraction of the entire heart, 4- it initiates an electrical impulse and causes a QRS wave in the electrocardiograph(ECG))

- A- 1, 3, 4 B- 2, 4 C- 1, 2, 4 D- 2, 3, 4

14-During inspiration, the diaphragm....., causing the air pressure inside the lungsthan the air pressure outside the body: -

- A- flattens, lower
B- contracts, higher
C- relaxes, lower
D- flattens, higher

15-When the, in the blood the sensors in the brain send a message to the respiratory muscles to return to a slower breathing rate.

- A- carbon dioxide concentration decreases
B- carbon dioxide concentration increases
C- the oxygen and carbon dioxide concentration increase
D- the oxygen concentration decreases

16-Plasma cells: -

- A- secrete antibodies
B- create holes in the membranes of the infected cells
C- make antibodies
D- both (A and C) are correct

17-Which of the following pairs are correctly matched? A- macrophages : display antigens on its surface

B- complement system proteins : are released by cells infected with virus

C- stomach acids : are specific defenses D- thymus : helps produce all kinds of lymphocytes.

18-In the primary and secondary immune responses: -

- A- memory cells are produced
B- antibodies are produced
C- antigens are attacked
D- all of them are correct

19-Both natural killer cells and inhibitory T cells

- A- are white blood cells.
B- play a part in humoral immune response.
C- carry antigens of pathogen on their surfaces
D- both (A and C) are correct

20-In phase II of HIV infection, all of the following occur **EXCEPT**:-

- A- the virus continues to replicate.
B- helper T cells can no longer stimulate B cells.
C- B cells continue to make a large amount of antibody against HIV
D- The number of helper T cells drops steadily

21-Opportunistic infections: -

- A- can be considered as evidence that the HIV infection has progressed to AIDS
B- the organisms of these diseases usually do not create problems in people with a healthy immune system
C- appear in phase I of HIV infection
D- both (A and B) are correct

22-All of the following are correct about chemical receptors, **EXCEPT**:

- A- are neurons that detect stimuli
B- are clustered in taste buds
C- are found in the mucous lining of the epithelium in the nasal passages
D- the action potentials they produce are interpreted only in the parietal lobe of the cerebral cortex

23-Which of the following is correct regarding the Schwann cell?

- A- transmits nerve impulses from the cell body towards the nerve endings
B- produces the myelin around the axon of neurons that are not found in the brain or in the spinal cord
C- receives stimuli from other neurons and transmits them towards the nerve endings
D- produces the myelin around the axon of all neurons

24-Tobacco: -

- A- contains no substance that causes addiction
B- causes chronic bronchitis
C- burning of it produces tars that paralyzes the cilia that line the respiratory tracts
D- both (B and C) are correct

25-Which of the following often results in addiction?

- A- tolerance
B- withdrawal
C- dependence
D- effective dose

26-Which of the following directs most incoming sensory signals to the proper region of the cerebral cortex:

- A- midbrain
B- medulla oblongata
C- pons
D- thalamus

27-In the process of hearing which of the following releases neurotransmitters?

- A- the hair cells
B- the fluid inside the cochlea
C- the membrane that covers the hair cells
D- the bottom membrane of the middle chamber

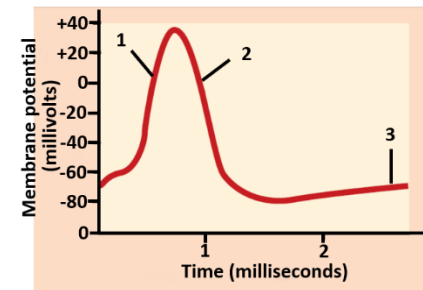

28-Which of the following is correct regarding the cerebellum?

- A- it lies below and before the cerebral hemispheres
C- It receives motor impulses coming from the ears

- B- the surface of cerebellum is highly folded
D- all of them are correct

29- Which point on the graph represents when the voltage-gated sodium channels are open?

- A- only 1
B- 1 and 3
C- only 3
D- 2 and 3

30-One of the following is secreted by a ductal gland:-

- A- aldosterone B- human chorionic gonadotropin C- cortisol D- lysozyme

31-The similarity between the mechanism of action of amino acid-based hormones and the mechanism of action of thyroid hormones is that both mechanisms need to: -

- A- target cell B- second messenger C- bind to its own receptor D- both (A and C) are correct

32-Which of the following is correct regarding the Langerhans Islands?

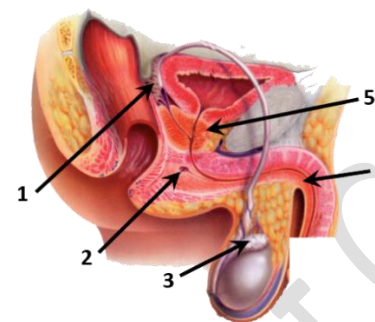

- A- secrete two amino acid-based hormones that lower the blood sugar level
B- contain mostly exocrine cells C- function as an endocrine gland. D- all of them are correct

33-Uterus contains target cells for which of the following hormones?

- A- estrogen B- progesterone C- oxytocin D- all of them are correct

34-Which structures of the adjacent figure are **NOT** within the path taken by the sperm as they leave the body?

- A- 2, 3, 5
B- 2, 3, 4
C- 1, 2, 5
D- 1, 2, 4

35-What is the role of the follicle-stimulating hormone in humans?

- A- along with testosterone, stimulates sperm production B- stimulates the secretion of testosterone
C- stimulates cell division in a follicle D- both (A and C) are correct

36-The male reproductive system structure that lies between the bladder and the rectum, produces a fluid: -

- A- rich in sugars B- that neutralizes the acids in the female reproductive system
C- that neutralizes traces of acidic urine in the urethra D- all of them are incorrect

37- In the adjacent figure, which number points to the membrane that surrounds all of the other embryonic membranes ?

- A- 1
B- 2
C- 3
D- 4

38-Which of the following does **NOT** occur during the first trimester of pregnancy?

- A- the legs, eyes, and ears have begun to develop B- the fetus can react to loud sounds.
C- fingers are formed. D- the heart begins to beat.

39-How many different genotypes can result from a dihybrid cross between two pea plants? If you know that one plant is a heterozygous of both traits and the other is unknown genotype, and that the ratio of heterozygous individuals for the two traits resulting from this cross is 25%.

- A- 2 B- 4 C- 8 D- all of them are incorrect

40-In which of the following states of the monohybrid crosses ,50% of the resulting individuals are recessive?

- A- If both parents are homozygous and dominant
B- If one of the parents is recessive and the other is heterozygous
C- If one of the parents is homozygous and dominant and the other is heterozygous
D- If both parents are heterozygous

41-In complete dominance the trait of smooth seeds appears when its genotype is.....,but the trait of the terminal flower appears when its genotype is.....

- A- only homozygous, only heterozygous B- only heterozygous, only homozygous
C- homozygous or heterozygous, only homozygous D- only heterozygous, homozygous or heterozygous

42-In which of the following crosses the ratio of genotype and the ratio of phenotype of the resulting individuals are equal?

- A- the cross between two heterozygous individuals in incomplete dominance
B- monohybrid cross between two heterozygous individuals in complete dominance
C- dihybrid cross between two homozygous individuals for both characteristics in complete dominance
D- both (A and C) are correct

43-If the probability that a specific trait will appear in a generation is ($\frac{3}{16}$) and the number of individuals for this trait is (300) individuals, what is the total number of individuals in this generation?

- A- 300 individuals B- 800 individuals C- 1600 individuals D- 2400 individuals

44- In the process of DNA replication: -

- A-the number of purines in one of the new strands is equal to the number of pyrimidines in the other new strand
B-the number of pyrimidines in one of the new strands is equal to the number of pyrimidines in the other new strand
C-each original strand serves as a template to make an identical strand as itself D- both (A and C) are correct

45-Considering the three components of a nucleotide, how many nucleotides are identical (which have the exact same structure) in both DNA and RNA?

- A- zero B- 2 C- 3 D- 4

46-Which of the following is **INCORRECT**?

- A- the codon AUG specifies the amino acid methionine in genetic code.
B- the number of anti-codons is 61 anti-codons.
C- the number of codons that specify amino acids is 61 codons
D- the codon GCU, which specifies the amino acid alanine in genetic code, can specify another different amino acid

47-Avery and his colleagues' experiments found that the cells.....unable to convert R cells into S cells.

- A- missing DNA B- containing DNA C- missing protein D- missing RNA

48-Based on the adjacent table, that shows the ratio of nitrogen bases in humans, virus X, and wheat, which of the following choices is correct:

	Adenine(A)	Thymine(T)	Guanine(G)	Cytosine(C)
Human	30.4	30.1	19.6	19.9
X virus	34.2	25.8	13.8	26.2
Wheat	27.3	27.1	22.7	22.8

- A- DNA in X virus is single-stranded DNA
B- DNA in human, X virus, and wheat are in the form of a double helix. .
C- the ratio of purines to pyrimidines in human, X virus and wheat is 1:1.
D- all of them are correct

49-Which of the following represents the sequence that was used to transcribed this sequence (CUC AAG UGC UUC) of mRNA?

- A- CUCAAGUGCUUC B- GAGUUCACGAAG C- GAGTTCACGAAG D- AGACCTGTAGGA

50-In each replication fork there are:-

- A- two helicases and one DNA polymerase B- one helicase and two DNA polymerases
C- one helicase and one DNA polymerase D- two helicases and two DNA polymerases

Note: choose the correct answer:

(2 marks for each right answer)

1-The male reproductive system structure that lies between the bladder and the rectum, produces a fluid: -

- A- rich in sugars B- that neutralizes the acids in the female reproductive system
C- that neutralizes traces of acidic urine in the urethra D- all of them are incorrect

2-Both natural killer cells and inhibitory T cells

- A- are white blood cells. B- play a part in humoral immune response.
C- carry antigens of pathogen on their surfaces D- both (A and C) are correct

3-When the, in the blood the sensors in the brain send a message to the respiratory muscles to return to a slower breathing rate.

- A- carbon dioxide concentration decreases B- carbon dioxide concentration increases
C- the oxygen and carbon dioxide concentration increase D- the oxygen concentration decreases

4-In this blood transfusion process $AB^+ \rightarrow O^-$:-

(1- anti-Rh antibodies will react with Rh antigens ,2- anti-A antibodies will react with A antigens, 3- anti-B antibodies will react with B antigens)

- A- 1 , 2 B- 1 , 2 , 3, C- 1 , 3 D- 2 , 3

5-In the primary and secondary immune responses: -

- A- memory cells are produced B- antibodies are produced
C- antigens are attacked D- all of them are correct

6-All of the following are correct about chemical receptors, **EXCEPT**:

- A- are neurons that detect stimuli B- are clustered in taste buds
C- are found in the mucous lining of the epithelium in the nasal passages
D-the action potentials they produce are interpreted only in the parietal lobe of the cerebral cortex

7-How many different genotypes can result from a dihybrid cross between two pea plants? If you know that one plant is a heterozygous of both traits and the other is unknown genotype, and that the ratio of heterozygous individuals for the two traits resulting from this cross is 25%.

- A- 2 B- 4 C- 8 D- all of them are incorrect

8- The adjacent figure shows which of the following?

- A- a Haversian canal that is surrounded by lamellae in compact bone.
B- a spongy bone that has a latticework structure.
C- a periosteum that contains a network of blood vessels.
D- a long bone cavity that contains the yellow bone marrow.

9-In the process of hearing which of the following releases neurotransmitters?

- A- the hair cells B- the fluid inside the cochlea
C- the membrane that covers the hair cells D- the bottom membrane of the middle chamber

10-Which of the following is **incorrect** for a relaxed muscle?

- A- the length of the actin and the myosin filaments does not change in comparison to a contracted muscle
B- the actin and myosin filaments overlap C- the actin and myosin filaments slide past each other
D- all of them are incorrect.

11-Which of the following are the characteristics of the atrioventricular node?

(1- It is located in the septum between the two ventricles, 2- it relays the electrical impulse to the muscle cells that make up the ventricles, 3- it regulates the rate of contraction of the entire heart, 4- it initiates an electrical impulse and causes a QRS wave in the electrocardiograph(ECG))

- A- 1, 3, 4 B- 2, 4 C- 1, 2, 4 D- 2, 3, 4

12-One of the following is secreted by a ductal gland:-

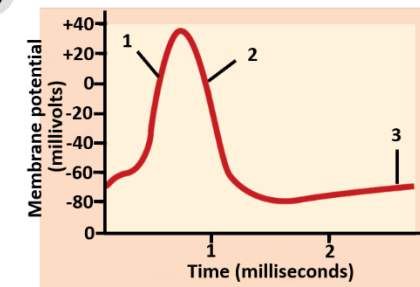

- A- aldosterone B- human chorionic gonadotropin C- cortisol D- lysozyme

13-Opportunistic infections: -

- A- can be considered as evidence that the HIV infection has progressed to AIDS
B- the organisms of these diseases usually do not create problems in people with a healthy immune system
C- appear in phase I of HIV infection D- both (A and B) are correct

14- Which point on the graph represents when the voltage-gated sodium channels are open?

- A- only 1
B- 1 and 3
C- only 3
D- 2 and 3

15-In the axial skeleton, the red bone marrow is found in the:-

- A- scapula B- clavicle C- sternum D- both (B and C) are correct

16-The cardiovascular system differs from the lymphatic system in that the cardiovascular system:

- A- is a part of the circulatory system B- contains red blood cells
C- its vessels are one-way that transport the fluid it contains from the tissues to the heart
D- contains lymphocytes

17-In skeletal muscle the tissue that bounds together a group of fascicles is a(an): -

- A- epithelial tissues B- nervous tissue C- muscle tissue D- connective tissue

18-What is the role of the follicle-stimulating hormone in humans?

- A- along with testosterone, stimulates sperm production B- stimulates the secretion of testosterone
C- stimulates cell division in a follicle D- both (A and C) are correct

19-Epiphyseal plate is **NOT** found at the ends of immature: -.

- A- fibula bone B- skull bones C- humerus bone D- tibia bone

20-Which of the following is a function of the long bone:

- A- its ability to contract and relax enables the body to move B- produces platelets
C- helps the body to maintain a constant temperature D- all of them are correct

21-Which of the following pairs are correctly matched? A- macrophages : display antigens on its surface

- B- complement system proteins : are released by cells infected with virus
C- stomach acids : are specific defenses D- thymus : helps produce all kinds of lymphocytes.

22-In phase II of HIV infection, all of the following occur **EXCEPT**:-

- A- the virus continues to replicate. B- helper T cells can no longer stimulate B cells.
C- B cells continue to make a large amount of antibody against HIV
D- The number of helper T cells drops steadily

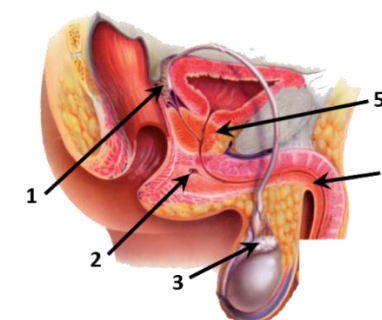

23-Which of the following is correct regarding the Schwann cell?

- A- transmits nerve impulses from the cell body towards the nerve endings
B- produces the myelin around the axon of neurons that are not found in the brain or in the spinal cord
C- receives stimuli from other neurons and transmits them towards the nerve endings
D- produces the myelin around the axon of all neurons

24-Which structures of the adjacent figure are **NOT** within the path taken

by the sperm as they leave the body?

- A- 2, 3, 5
B- 2, 3, 4
C- 1, 2, 5
D- 1, 2, 4

25-During inspiration, the diaphragm....., causing the air pressure inside the lungsthan the air pressure outside the body: -

- A- flattens, lower B- contracts, higher
C- relaxes, lower D- flattens, higher

26-Which of the following often results in addiction?

- A- tolerance B- withdrawal C- dependence D- effective dose

27-Which of the following is correct about red blood cells?

- A-** immature red blood cells synthesize large amounts of hemoglobin
B- their cell nucleus and organelles disintegrate **C-** they form antibodies **D-** both (A and B) are correct

28-Tobacco: -

- A-** contains no substance that causes addiction **B-** causes chronic bronchitis
C- burning of it produces tars that paralyzes the cilia that line the respiratory tracts **D-** both (B and C) are correct

29-Uterus contains target cells for which of the following hormones?

- A-** estrogen **B-** progesterone **C-** oxytocin **D-** all of them are correct

30-Which of the following is correct regarding the Langerhans Islands?

- A-** secrete two amino acid-based hormones that lower the blood sugar level
B- contain mostly exocrine cells **C-** function as an endocrine gland. **D-** all of them are correct

31-Which of the following does NOT occur during the first trimester of pregnancy?

- A-** the legs, eyes, and ears have begun to develop **B-** the fetus can react to loud sounds.
C- fingers are formed. **D-** the heart begins to beat.

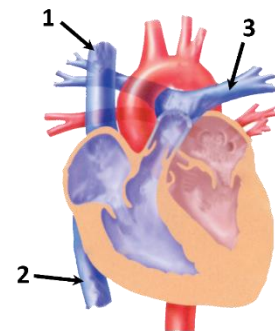

32-Which of the following directs most incoming sensory signals to the proper region of the cerebral cortex:

- A-** midbrain **B-** medulla oblongata **C-** pons **D-** thalamus

33-Depending on the adjacent figure, all blood vessels

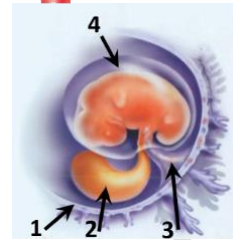

that are labeled by numbers 1, 2, 3: -

- A-** are veins
B- carry deoxygenated blood to the heart
C- their walls are made up of three layers
D- both (A and C) are correct

34- In the adjacent figure, which number points to the membrane that surrounds all of the other embryonic membranes ?

- A-** 1
B- 2
C- 3
D- 4

35-The similarity between the mechanism of action of amino acid-based hormones and the mechanism of action of thyroid hormones is that both mechanisms need to: -

- A-** target cell **B-** second messenger **C-** bind to its own receptor **D-** both (A and C) are correct

36-Which of the following is correct regarding the cerebellum?

- A-** it lies below and before the cerebral hemispheres **B-** the surface of cerebellum is highly folded
C- It receives motor impulses coming from the ears **D-** all of them are correct

37-Plasma cells: -

- A-** secrete antibodies **B-** create holes in the membranes of the infected cells
C- make antibodies **D-** both (A and C) are correct

38-Which of the following is incorrect?

(1- Only artery carries oxygenated blood, 2- The artery and the vein both have an inner layer of endothelial tissue, 3- The artery divides into smaller blood vessels until they end in capillaries, 4- Only vein carries deoxygenated blood).

- A-** 1, 3, 4 **B-** 1, 4 **C-** 1, 2, 4 **D-** 2, 3, 4

39-The smooth muscle differs from the skeletal muscle in that the smooth muscle: -

- A-** has origin and insertion points **B-** is striated **C-** forms the walls of the internal organs **D-** is voluntary

40-In which of the following states of the monohybrid crosses ,50% of the resulting individuals are recessive?

- A-** If both parents are homozygous and dominant
B- If one of the parents is recessive and the other is heterozygous
C- If one of the parents is homozygous and dominant and the other is heterozygous
D- If both parents are heterozygous

41- In the process of DNA replication: -

- A-**the number of purines in one of the new strands is equal to the number of pyrimidines in the other new strand
B-the number of pyrimidines in one of the new strands is equal to the number of pyrimidines in the other new strand
C-each original strand serves as a template to make an identical strand as itself **D-** both (A and C) are correct

42-Considering the three components of a nucleotide, how many nucleotides are identical (which have the exact same structure) in both DNA and RNA?

- A-** zero **B-** 2 **C-** 3 **D-** 4

43-In complete dominance the trait of smooth seeds appears when its genotype is.....,but the trait of the terminal flower appears when its genotype is.....

- A-** only homozygous, only heterozygous **B-** only heterozygous, only homozygous
C- homozygous or heterozygous, only homozygous **D-** only heterozygous, homozygous or heterozygous

44-Based on the adjacent table, that shows the ratio of nitrogen bases in humans, virus X, and wheat, which of the following choices is correct:

	Adenine(A)	Thymine(T)	Guanine(G)	Cytosine(C)
Human	30.4	30.1	19.6	19.9
X virus	34.2	25.8	13.8	26.2
Wheat	27.3	27.1	22.7	22.8

A- DNA in X virus is single-stranded DNA

B- DNA in human, X virus, and wheat are in the form of a double helix. .

C- the ratio of purines to pyrimidines in human, X virus and wheat is 1:1.

D- all of them are correct

45-Which of the following represents the sequence that was used to transcribed this sequence (CUC AAG UGC UUC) of mRNA?

- A-** CUCAAGUGCUUC **B-** GAGUUCACGAAG **C-** GAGTTCACGAAG **D-** AGACCTGTAGGA

46-If the probability that a specific trait will appear in a generation is ($\frac{3}{16}$) and the number of individuals for this trait is (300) individuals, what is the total number of individuals in this generation?

- A-** 300 individuals **B-** 800 individuals **C-** 1600 individuals **D-** 2400 individuals

47-Avery and his colleagues' experiments found that the cells.....unable to convert R cells into S cells.

- A-** missing DNA **B-** containing DNA **C-** missing protein **D-** missing RNA

48-Which of the following is INCORRECT?

A- the codon AUG specifies the amino acid methionine in genetic code.

B- the number of anti-codons is 61 anti-codons.

C- the number of codons that specify amino acids is 61 codons

D- the codon GCU, which specifies the amino acid alanine in genetic code, can specify another different amino acid

49-In each replication fork there are:-

A- two helicases and one DNA polymerase

B- one helicase and two DNA polymerases

C- one helicase and one DNA polymerase

D- two helicases and two DNA polymerases

50-In which of the following crosses the ratio of genotype and the ratio of phenotype of the resulting individuals are equal?

A- the cross between two heterozygous individuals in incomplete dominance

B- monohybrid cross between two heterozygous individuals in complete dominance

C- dihybrid cross between two homozygous individuals for both characteristics in complete dominance

D- both (A and C) are correct

Note: choose the correct answer:

(2 marks for each right answer)

1-Which of the following is **incorrect** for a relaxed muscle?

- A- the length of the actin and the myosin filaments does not change in comparison to a contracted muscle
B- the actin and myosin filaments overlap
C- the actin and myosin filaments slide past each other
D- all of them are incorrect.

2-Which of the following is a function of the long bone:

- A- its ability to contract and relax enables the body to move
C- helps the body to maintain a constant temperature

- B- produces platelets
D- all of them are correct

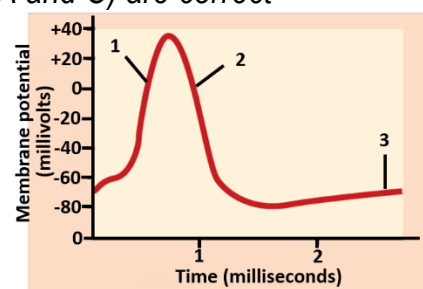

3-Both natural killer cells and inhibitory T cells

- A- are white blood cells.
C- carry antigens of pathogen on their surfaces

- B- play a part in humoral immune response.
D- both (A and C) are correct

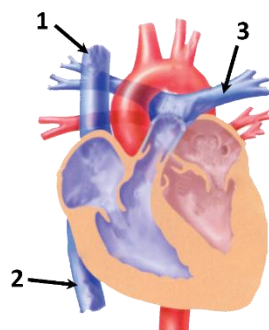

4- Which point on the graph represents when the voltage-gated sodium channels are open?

- A- only 1
B- 1 and 3
C- only 3
D- 2 and 3

5-Depending on the adjacent figure, all blood vessels that are labeled by numbers 1, 2, 3: -

- A- are veins
B- carry deoxygenated blood to the heart
C- their walls are made up of three layers
D- both (A and C) are correct

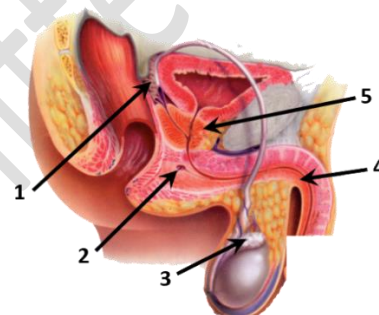

6-Tobacco: -

- A- contains no substance that causes addiction
B- causes chronic bronchitis
C- burning of it produces tars that paralyzes the cilia that line the respiratory tracts
D- both (B and C) are correct

7-Which structures of the adjacent figure are **NOT** within the path taken by the sperm as they leave the body?

- A- 2, 3, 5
B- 2, 3, 4
C- 1, 2, 5
D- 1, 2, 4

8-Which of the following often results in addiction?

- A- tolerance
B- withdrawal
C- dependence
D- effective dose

9-In phase II of HIV infection, all of the following occur **EXCEPT**: -

- A- the virus continues to replicate.
B- helper T cells can no longer stimulate B cells.
C- B cells continue to make a large amount of antibody against HIV
D- The number of helper T cells drops steadily

10-In the primary and secondary immune responses: -

- A- memory cells are produced
B- antibodies are produced
C- antigens are attacked
D- all of them are correct

11-The male reproductive system structure that lies between the bladder and the rectum, produces a fluid: -

- A- rich in sugars
B- that neutralizes the acids in the female reproductive system
C- that neutralizes traces of acidic urine in the urethra
D- all of them are incorrect

12-In skeletal muscle the tissue that bounds together a group of fascicles is a(an): -

- A- epithelial tissues
B- nervous tissue
C- muscle tissue
D- connective tissue

13-How many different genotypes can result from a dihybrid cross between two pea plants? If you know that one plant is a heterozygous of both traits and the other is unknown genotype, and that the ratio of heterozygous individuals for the two traits resulting from this cross is 25%.

- A- 2
B- 4
C- 8
D- all of them are incorrect

14-Plasma cells: -

- A- secrete antibodies
B- create holes in the membranes of the infected cells
C- make antibodies
D- both (A and C) are correct

15-Which of the following is **incorrect**?

(1- Only artery carries oxygenated blood, 2- The artery and the vein both have an inner layer of endothelial tissue, 3- The artery divides into smaller blood vessels until they end in capillaries, 4- Only vein carries deoxygenated blood).

- A- 1, 3, 4
B- 1, 4
C- 1, 2, 4
D- 2, 3, 4

16-In this blood transfusion process $AB^+ \rightarrow O^-$:-

(1- anti-Rh antibodies will react with Rh antigens ,2- anti-A antibodies will react with A antigens, 3- anti-B antibodies will react with B antigens)

- A- 1, 2
B- 1, 2, 3,
C- 1, 3
D- 2, 3

17-Which of the following does **NOT** occur during the first trimester of pregnancy?

- A- the legs, eyes, and ears have begun to develop
B- the fetus can react to loud sounds.
C- fingers are formed.
D- the heart begins to beat.

18-The cardiovascular system differs from the lymphatic system in that the cardiovascular system:

- A- is a part of the circulatory system
B- contains red blood cells
C- its vessels are one-way that transport the fluid it contains from the tissues to the heart
D- contains lymphocytes

19-Uterus contains target cells for which of the following hormones?

- A- estrogen
B- progesterone
C- oxytocin
D- all of them are correct

20-Which of the following directs most incoming sensory signals to the proper region of the cerebral cortex:

- A- midbrain
B- medulla oblongata
C- pons
D- thalamus

21-Opportunistic infections: -

- A- can be considered as evidence that the HIV infection has progressed to AIDS
B- the organisms of these diseases usually do not create problems in people with a healthy immune system
C- appear in phase I of HIV infection
D- both (A and B) are correct

22-The smooth muscle differs from the skeletal muscle in that the smooth muscle: -

- A- has origin and insertion points
B- is striated
C- forms the walls of the internal organs
D- is voluntary

23-During inspiration, the diaphragm....., causing the air pressure inside the lungsthan the air pressure outside the body: -

- A- flattens, lower
B- contracts, higher
C- relaxes, lower
D- flattens, higher

24-In the axial skeleton, the red bone marrow is found in the:-

- A- scapula
B- clavicle
C- sternum
D- both (B and C) are correct

25-What is the role of the follicle-stimulating hormone in humans?

- A- along with testosterone, stimulates sperm production
B- stimulates the secretion of testosterone
C- stimulates cell division in a follicle
D- both (A and C) are correct

26-Which of the following is correct regarding the Schwann cell?

- A- transmits nerve impulses from the cell body towards the nerve endings
B- produces the myelin around the axon of neurons that are not found in the brain or in the spinal cord
C- receives stimuli from other neurons and transmits them towards the nerve endings
D- produces the myelin around the axon of all neurons

27-Which of the following is correct about red blood cells?

- A- immature red blood cells synthesize large amounts of hemoglobin
B- their cell nucleus and organelles disintegrate
C- they form antibodies
D- both (A and B) are correct

28- The adjacent figure shows which of the following?

- A- a Haversian canal that is surrounded by lamellae in compact bone.
- B- a spongy bone that has a latticework structure.
- C- a periosteum that contains a network of blood vessels.
- D- a long bone cavity that contains the yellow bone marrow.

29-All of the following are correct about chemical receptors, **EXCEPT**:

- A- are neurons that detect stimuli
- B- are clustered in taste buds
- C- are found in the mucous lining of the epithelium in the nasal passages
- D- the action potentials they produce are interpreted only in the parietal lobe of the cerebral cortex

30-One of the following is secreted by a ductal gland:-

- A- aldosterone
- B- human chorionic gonadotropin
- C- cortisol
- D- lysozyme

31-Which of the following are the characteristics of the atrioventricular node?

- (1- It is located in the septum between the two ventricles, 2- it relays the electrical impulse to the muscle cells that make up the ventricles, 3- it regulates the rate of contraction of the entire heart, 4- it initiates an electrical impulse and causes a QRS wave in the electrocardiograph(ECG))

- A- 1, 3, 4
- B- 2, 4
- C- 1, 2, 4
- D- 2, 3, 4

32-Which of the following is correct regarding the cerebellum?

- A- it lies below and before the cerebral hemispheres
- B- the surface of cerebellum is highly folded
- C- It receives motor impulses coming from the ears
- D- all of them are correct

33-Epiphyseal plate is **NOT** found at the ends of immature: -.

- A- fibula bone
- B- skull bones
- C- humerus bone
- D- tibia bone

34-Which of the following is correct regarding the Langerhans Islands?

- A- secrete two amino acid-based hormones that lower the blood sugar level
- B- contain mostly exocrine cells
- C- function as an endocrine gland.
- D- all of them are correct

35-Which of the following pairs are correctly matched? A- macrophages : display antigens on its surface

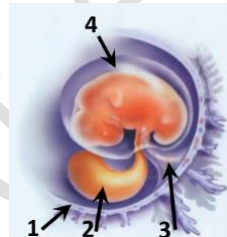

- B- complement system proteins : are released by cells infected with virus
- C- stomach acids : are specific defenses
- D- thymus : helps produce all kinds of lymphocytes.

36-When the, in the blood the sensors in the brain send a message to the respiratory muscles to return to a slower breathing rate.

- A- carbon dioxide concentration decreases
- B- carbon dioxide concentration increases
- C- the oxygen and carbon dioxide concentration increase
- D- the oxygen concentration decreases

37- In the adjacent figure, which number points to the membrane that surrounds all of the other embryonic membranes ?

- A- 1
- B- 2
- C- 3
- D- 4

38-In the process of hearing which of the following releases neurotransmitters?

- A- the hair cells
- B- the fluid inside the cochlea
- C- the membrane that covers the hair cells
- D- the bottom membrane of the middle chamber

39-The similarity between the mechanism of action of amino acid-based hormones and the mechanism of action of thyroid hormones is that both mechanisms need to: -

- A- target cell
- B- second messenger
- C- bind to its own receptor
- D- both (A and C) are correct

40-In which of the following states of the monohybrid crosses ,50% of the resulting individuals are recessive?

- A- If both parents are homozygous and dominant
- B- If one of the parents is recessive and the other is heterozygous
- C- If one of the parents is homozygous and dominant and the other is heterozygous
- D- If both parents are heterozygous

41-In which of the following crosses the ratio of genotype and the ratio of phenotype of the resulting individuals are equal?

- A- the cross between two heterozygous individuals in incomplete dominance
- B- monohybrid cross between two heterozygous individuals in complete dominance
- C- dihybrid cross between two homozygous individuals for both characteristics in complete dominance
- D- both (A and C) are correct

42-Which of the following is **INCORRECT**?

- A- the codon AUG specifies the amino acid methionine in genetic code.
- B- the number of anti-codons is 61 anti-codons.
- C- the number of codons that specify amino acids is 61 codons
- D- the codon GCU, which specifies the amino acid alanine in genetic code, can specify another different amino acid

43- In the process of DNA replication: -

- A- the number of purines in one of the new strands is equal to the number of pyrimidines in the other new strand
- B- the number of pyrimidines in one of the new strands is equal to the number of pyrimidines in the other new strand
- C- each original strand serves as a template to make an identical strand as itself
- D- both (A and C) are correct

44-If the probability that a specific trait will appear in a generation is ($\frac{3}{16}$) and the number of individuals for this trait is (300) individuals, what is the total number of individuals in this generation?

- A- 300 individuals
- B- 800 individuals
- C- 1600 individuals
- D- 2400 individuals

45-In complete dominance the trait of smooth seeds appears when its genotype is.....,but the trait of the terminal flower appears when its genotype is.....

- A- only homozygous, only heterozygous
- B- only heterozygous, only homozygous
- C- homozygous or heterozygous, only homozygous
- D- only heterozygous, homozygous or heterozygous

46-Based on the adjacent table, that shows the ratio of nitrogen bases in humans, virus X, and wheat, which of the following choices is correct:

	Adenine(A)	Thymine(T)	Guanine(G)	Cytosine(C)
Human	30.4	30.1	19.6	19.9
X virus	34.2	25.8	13.8	26.2
Wheat	27.3	27.1	22.7	22.8

- A- DNA in X virus is single-stranded DNA
- B- DNA in human, X virus, and wheat are in the form of a double helix. .
- C- the ratio of purines to pyrimidines in human, X virus and wheat is 1:1.
- D- all of them are correct

47-Which of the following represents the sequence that was used to transcribed this sequence (CUC AAG UGC UUC) of mRNA?

- A- CUCAAGUGCUUC
- B- GAGUUCACGAAG
- C- GAGTTCACGAAG
- D- AGACCTGTAGGA

48-Avery and his colleagues' experiments found that the cells.....unable to convert R cells into S cells.

- A- missing DNA
- B- containing DNA
- C- missing protein
- D- missing RNA

49-Considering the three components of a nucleotide, how many nucleotides are identical (which have the exact same structure) in both DNA and RNA?

- A- zero
- B- 2
- C- 3
- D- 4

50-In each replication fork there are:-

- A- two helicases and one DNA polymerase
- B- one helicase and two DNA polymerases
- C- one helicase and one DNA polymerase
- D- two helicases and two DNA polymerases

Note: choose the correct answer:

(2 marks for each right answer)

1-The similarity between the mechanism of action of amino acid-based hormones and the mechanism of action of thyroid hormones is that both mechanisms need to: -

A- target cell B- second messenger C- bind to its own receptor D- both (A and C) are correct

2-Which of the following is correct regarding the Schwann cell?

A- transmits nerve impulses from the cell body towards the nerve endings
B- produces the myelin around the axon of neurons that are not found in the brain or in the spinal cord
C- receives stimuli from other neurons and transmits them towards the nerve endings
D- produces the myelin around the axon of all neurons

3-In the axial skeleton, the red bone marrow is found in the:-

A- scapula B- clavicle C- sternum D- both (B and C) are correct

4-Which of the following is correct regarding the Langerhans Islands?

A- secrete two amino acid-based hormones that lower the blood sugar level
B- contain mostly exocrine cells C- function as an endocrine gland. D- all of them are correct

5-Plasma cells: -

A- secrete antibodies B- create holes in the membranes of the infected cells
C- make antibodies D- both (A and C) are correct

6-Epiphyseal plate is **NOT** found at the ends of immature: -

A- fibula bone B- skull bones C- humerus bone D- tibia bone

7-The male reproductive system structure that lies between the bladder and the rectum, produces a fluid: -

A- rich in sugars B- that neutralizes the acids in the female reproductive system
C- that neutralizes traces of acidic urine in the urethra D- all of them are incorrect

8-Which structures of the adjacent figure are **NOT** within the path taken

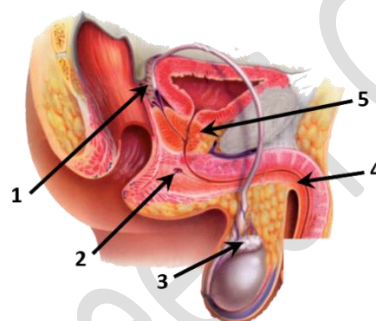

by the sperm as they leave the body?

A- 2, 3, 5

B- 2, 3, 4

C- 1, 2, 5

D- 1, 2, 4

9-Which of the following is correct regarding the cerebellum?

A- it lies below and before the cerebral hemispheres B- the surface of cerebellum is highly folded
C- It receives motor impulses coming from the ears D- all of them are correct

10-Which of the following are the characteristics of the atrioventricular node?

(1- It is located in the septum between the two ventricles, 2- it relays the electrical impulse to the muscle cells that make up the ventricles, 3- it regulates the rate of contraction of the entire heart, 4- it initiates an electrical impulse and causes a QRS wave in the electrocardiograph(ECG))

A- 1, 3, 4 B- 2, 4 C- 1, 2, 4 D- 2, 3, 4

11-Which of the following often results in addiction?

A- tolerance B- withdrawal C- dependence D- effective dose

12-Which of the following is **incorrect** for a relaxed muscle?

A- the length of the actin and the myosin filaments does not change in comparison to a contracted muscle
B- the actin and myosin filaments overlap C- the actin and myosin filaments slide past each other
D- all of them are incorrect.

13-Tobacco: -

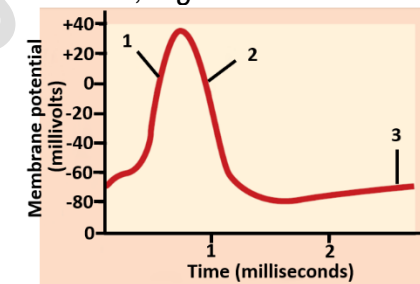

A- contains no substance that causes addiction B- causes chronic bronchitis
C- burning of it produces tars that paralyzes the cilia that line the respiratory tracts D- both (B and C) are correct

14-During inspiration, the diaphragm....., causing the air pressure inside the lungsthan the air pressure outside the body: -

A- flattens, lower B- contracts, higher
C- relaxes, lower D- flattens, higher

15- Which point on the graph represents when the voltage-gated sodium channels are open?

A- only 1
B- 1 and 3
C- only 3
D- 2 and 3

16-How many different genotypes can result from a dihybrid cross between two pea plants? If you know that one plant is a heterozygous of both traits and the other is unknown genotype, and that the ratio of heterozygous individuals for the two traits resulting from this cross is 25%.

A- 2 B- 4 C- 8 D- all of them are incorrect

17-Which of the following is a function of the long bone:

A- its ability to contract and relax enables the body to move B- produces platelets
C- helps the body to maintain a constant temperature D- all of them are correct

18-In skeletal muscle the tissue that bounds together a group of fascicles is a(an): -

A- epithelial tissues B- nervous tissue C- muscle tissue D- connective tissue

19-Which of the following is **incorrect**?

(1- Only artery carries oxygenated blood, 2- The artery and the vein both have an inner layer of endothelial tissue, 3- The artery divides into smaller blood vessels until they end in capillaries, 4- Only vein carries deoxygenated blood).

A- 1, 3, 4 B- 1, 4 C- 1, 2, 4 D- 2, 3, 4

20-Which of the following directs most incoming sensory signals to the proper region of the cerebral cortex:

A- midbrain B- medulla oblongata C- pons D- thalamus

21-Which of the following does **NOT** occur during the first trimester of pregnancy?

A- the legs, eyes, and ears have begun to develop B- the fetus can react to loud sounds.
C- fingers are formed. D- the heart begins to beat.

22- The adjacent figure shows which of the following?

A- a Haversian canal that is surrounded by lamellae in compact bone.
B- a spongy bone that has a latticework structure.
C- a periosteum that contains a network of blood vessels.
D- a long bone cavity that contains the yellow bone marrow.

23-What is the role of the follicle-stimulating hormone in humans?

A- along with testosterone, stimulates sperm production B- stimulates the secretion of testosterone
C- stimulates cell division in a follicle D- both (A and C) are correct

24-Which of the following is correct about red blood cells?

A- immature red blood cells synthesize large amounts of hemoglobin
B- their cell nucleus and organelles disintegrate C- they form antibodies D- both (A and B) are correct

25-Both natural killer cells and inhibitory T cells

A- are white blood cells. B- play a part in humoral immune response.
C- carry antigens of pathogen on their surfaces D- both (A and C) are correct

26-When the, in the blood the sensors in the brain send a message to the respiratory muscles to return to a slower breathing rate.

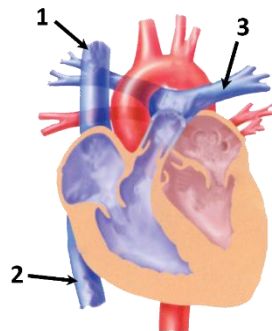

A- carbon dioxide concentration decreases B- carbon dioxide concentration increases
C- the oxygen and carbon dioxide concentration increase D- the oxygen concentration decreases

27-The cardiovascular system differs from the lymphatic system in that the cardiovascular system:

A- is a part of the circulatory system B- contains red blood cells
C- its vessels are one-way that transport the fluid it contains from the tissues to the heart
D- contains lymphocytes

28-Which of the following pairs are correctly matched? A- macrophages : display antigens on its surface
B- complement system proteins : are released by cells infected with virus
C- stomach acids : are specific defenses D- thymus : helps produce all kinds of lymphocytes.

29-Depending on the adjacent figure, all blood vessels that are labeled by numbers 1, 2, 3: -

- A- are veins
- B- carry deoxygenated blood to the heart
- C- their walls are made up of three layers
- D- both (A and C) are correct

30-The smooth muscle differs from the skeletal muscle in that the smooth muscle: -
A- has origin and insertion points B- is striated C- forms the walls of the internal organs D- is voluntary

31-Uterus contains target cells for which of the following hormones?
A- estrogen B- progesterone C- oxytocin D- all of them are correct

32-Opportunistic infections: -
A- can be considered as evidence that the HIV infection has progressed to AIDS
B- the organisms of these diseases usually do not create problems in people with a healthy immune system
C- appear in phase I of HIV infection D- both (A and B) are correct

33-In the primary and secondary immune responses: -
A- memory cells are produced B- antibodies are produced
C- antigens are attacked D- all of them are correct

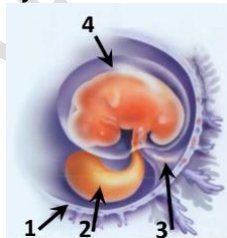

34-In this blood transfusion process $AB^+ \longrightarrow O^-$:-
(1- anti-Rh antibodies will react with Rh antigens ,2- anti-A antibodies will react with A antigens, 3- anti-B antibodies will react with B antigens)
A- 1 , 2 B- 1 , 2 , 3, C- 1 , 3 D-.2 , 3

35-In the process of hearing which of the following releases neurotransmitters?
A- the hair cells B- the fluid inside the cochlea
C- the membrane that covers the hair cells D- the bottom membrane of the middle chamber

36-All of the following are correct about chemical receptors, **EXCEPT**:
A- are neurons that detect stimuli B- are clustered in taste buds
C- are found in the mucous lining of the epithelium in the nasal passages
D-the action potentials they produce are interpreted only in the parietal lobe of the cerebral cortex

37-One of the following is secreted by a ductal gland:-
A- aldosterone B- human chorionic gonadotropin C- cortisol D- lysozyme

38- In the adjacent figure, which number points to the membrane that surrounds all of the other embryonic membranes ?
A- 1
B- 2
C- 3
D- 4

39-In phase II of HIV infection, all of the following occur **EXCEPT**: -
A- the virus continues to replicate. B- helper T cells can no longer stimulate B cells.
C- B cells continue to make a large amount of antibody against HIV
D- The number of helper T cells drops steadily

40-In which of the following states of the monohybrid crosses ,50% of the resulting individuals are recessive?
A- If both parents are homozygous and dominant
B- If one of the parents is recessive and the other is heterozygous
C- If one of the parents is homozygous and dominant and the other is heterozygous
D- If both parents are heterozygous

41-If the probability that a specific trait will appear in a generation is ($\frac{3}{16}$) and the number of individuals for this trait is (300) individuals, what is the total number of individuals in this generation?
A- 300 individuals B- 800 individuals C- 1600 individuals D- 2400 individuals

42-Which of the following is **INCORRECT**?
A- the codon AUG specifies the amino acid methionine in genetic code.
B- the number of anti-codons is 61 anti-codons.
C- the number of codons that specify amino acids is 61 codons
D- the codon GCU, which specifies the amino acid alanine in genetic code, can specify another different amino acid

43-Which of the following represents the sequence that was used to transcribed this sequence (CUC AAG UGC UUC) of mRNA?
A- CUCAAGUGCUUC B- GAGUUCACGAAG C- GAGTTCACGAAG D- AGACCTGTAGGA

44-Considering the three components of a nucleotide, how many nucleotides are identical (which have the exact same structure) in both DNA and RNA?
A- zero B- 2 C- 3 D- 4

45-Avery and his colleagues' experiments found that the cells.....unable to convert R cells into S cells.
A- missing DNA B- containing DNA C- missing protein D- missing RNA

46-In each replication fork there are:-
A- two helicases and one DNA polymerase B- one helicase and two DNA polymerases
C- one helicase and one DNA polymerase D- two helicases and two DNA polymerases

47-Based on the adjacent table, that shows the ratio of nitrogen bases in humans, virus X, and wheat, which of the following choices is correct:

	Adenine(A)	Thymine(T)	Guanine(G)	Cytosine(C)
Human	30.4	30.1	19.6	19.9
X virus	34.2	25.8	13.8	26.2
Wheat	27.3	27.1	22.7	22.8

A- DNA in X virus is single-stranded DNA
B- DNA in human, X virus, and wheat are in the form of a double helix. .
C- the ratio of purines to pyrimidines in human, X virus and wheat is 1:1.
D- all of them are correct

48-In which of the following crosses the ratio of genotype and the ratio of phenotype of the resulting individuals are equal?
A- the cross between two heterozygous individuals in incomplete dominance
B- monohybrid cross between two heterozygous individuals in complete dominance
C- dihybrid cross between two homozygous individuals for both characteristics in complete dominance
D- both (A and C) are correct

49- In the process of DNA replication: -
A-the number of purines in one of the new strands is equal to the number of pyrimidines in the other new strand
B-the number of pyrimidines in one of the new strands is equal to the number of pyrimidines in the other new strand
C-each original strand serves as a template to make an identical strand as itself D- both (A and C) are correct

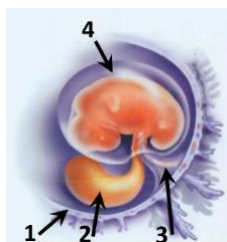

50-In complete dominance the trait of smooth seeds appears when its genotype is.....,but the trait of the terminal flower appears when its genotype is.....
A- only homozygous, only heterozygous B- only heterozygous, only homozygous
C- homozygous or heterozygous, only homozygous D- only heterozygous, homozygous or heterozygous

Note: choose the correct answer: (2 marks for each right answer)

1- In the adjacent figure, which number points to the membrane that surrounds all of the other embryonic membranes ?

- A- 1
- B- 2
- C- 3
- D- 4

2-Opportunistic infections: -

- A- can be considered as evidence that the HIV infection has progressed to AIDS
- B- the organisms of these diseases usually do not create problems in people with a healthy immune system
- C- appear in phase I of HIV infection
- D- both (A and B) are correct

3-What is the role of the follicle-stimulating hormone in humans?

- A- along with testosterone, stimulates sperm production
- B- stimulates the secretion of testosterone
- C- stimulates cell division in a follicle
- D- both (A and C) are correct

4-The smooth muscle differs from the skeletal muscle in that the smooth muscle: -

- A- has origin and insertion points
- B- is striated
- C- forms the walls of the internal organs
- D- is voluntary

5-Epiphyseal plate is **NOT** found at the ends of immature: -

- A- fibula bone
- B- skull bones
- C- humerus bone
- D- tibia bone

6-Which of the following is a function of the long bone:

- A- its ability to contract and relax enables the body to move
- B- produces platelets
- C- helps the body to maintain a constant temperature
- D- all of them are correct

7- The adjacent figure shows which of the following?

- A- a Haversian canal that is surrounded by lamellae in compact bone.
- B- a spongy bone that has a latticework structure.
- C- a periosteum that contains a network of blood vessels.
- D- a long bone cavity that contains the yellow bone marrow.

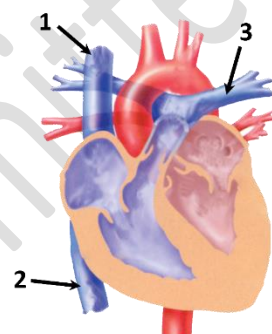

8-In the primary and secondary immune responses: -

- A- memory cells are produced
- B- antibodies are produced
- C- antigens are attacked
- D- all of them are correct

9-Depending on the adjacent figure, all blood vessels

that are labeled by numbers 1, 2, 3: -

- A- are veins
- B- carry deoxygenated blood to the heart
- C- their walls are made up of three layers
- D- both (A and C) are correct

10-In skeletal muscle the tissue that bounds together a group of fascicles is a(an): -

- A- epithelial tissues
- B- nervous tissue
- C- muscle tissue
- D- connective tissue

11-Uterus contains target cells for which of the following hormones?

- A- estrogen
- B- progesterone
- C- oxytocin
- D- all of them are correct

12-In the axial skeleton, the red bone marrow is found in the:-

- A- scapula
- B- clavicle
- C- sternum
- D- both (B and C) are correct

13-In the process of hearing which of the following releases neurotransmitters?

- A- the hair cells
- B- the fluid inside the cochlea
- C- the membrane that covers the hair cells
- D- the bottom membrane of the middle chamber

14-During inspiration, the diaphragm....., causing the air pressure inside the lungsthan the air pressure outside the body: -

- A- flattens, lower
- B- contracts, higher
- C- relaxes, lower
- D- flattens, higher

15-Which of the following is correct regarding the Schwann cell?

- A- transmits nerve impulses from the cell body towards the nerve endings
- B- produces the myelin around the axon of neurons that are not found in the brain or in the spinal cord
- C- receives stimuli from other neurons and transmits them towards the nerve endings
- D- produces the myelin around the axon of all neurons

16-Plasma cells: -

- A- secrete antibodies
- B- create holes in the membranes of the infected cells
- C- make antibodies
- D- both (A and C) are correct

17-The similarity between the mechanism of action of amino acid-based hormones and the mechanism of action of thyroid hormones is that both mechanisms need to: -

- A- target cell
- B- second messenger
- C- bind to its own receptor
- D- both (A and C) are correct

18-Which of the following are the characteristics of the atrioventricular node?

(1- It is located in the septum between the two ventricles, 2- it relays the electrical impulse to the muscle cells that make up the ventricles, 3- it regulates the rate of contraction of the entire heart, 4- it initiates an electrical impulse and causes a QRS wave in the electrocardiograph(ECG))

- A- 1, 3, 4
- B- 2, 4
- C- 1, 2, 4
- D- 2, 3, 4

19-How many different genotypes can result from a dihybrid cross between two pea plants? If you know that one plant is a heterozygous of both traits and the other is unknown genotype, and that the ratio of heterozygous individuals for the two traits resulting from this cross is 25%.

- A- 2
- B- 4
- C- 8
- D- all of them are incorrect

20-Which of the following is correct regarding the cerebellum?

- A- it lies below and before the cerebral hemispheres
- B- the surface of cerebellum is highly folded
- C- It receives motor impulses coming from the ears
- D- all of them are correct

21-All of the following are correct about chemical receptors, **EXCEPT**:

- A- are neurons that detect stimuli
- B- are clustered in taste buds
- C- are found in the mucous lining of the epithelium in the nasal passages
- D- the action potentials they produce are interpreted only in the parietal lobe of the cerebral cortex

22-Both natural killer cells and inhibitory T cells

- A- are white blood cells.
- B- play a part in humoral immune response.
- C- carry antigens of pathogen on their surfaces
- D- both (A and C) are correct

23-Which of the following is **incorrect**?

(1- Only artery carries oxygenated blood, 2- The artery and the vein both have an inner layer of endothelial tissue, 3- The artery divides into smaller blood vessels until they end in capillaries, 4- Only vein carries deoxygenated blood).

- A- 1, 3, 4
- B- 1, 4
- C- 1, 2, 4
- D- 2, 3, 4

24-Tobacco: -

- A- contains no substance that causes addiction
- B- causes chronic bronchitis
- C- burning of it produces tars that paralyzes the cilia that line the respiratory tracts
- D- both (B and C) are correct

25-The male reproductive system structure that lies between the bladder and the rectum, produces a fluid: -

- A- rich in sugars
- B- that neutralizes the acids in the female reproductive system
- C- that neutralizes traces of acidic urine in the urethra
- D- all of them are incorrect

26-Which of the following directs most incoming sensory signals to the proper region of the cerebral cortex:

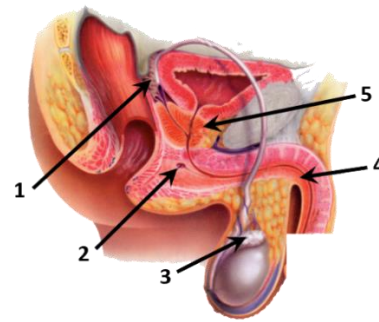

- A- midbrain
- B- medulla oblongata
- C- pons
- D- thalamus

27-The cardiovascular system differs from the lymphatic system in that the cardiovascular system:

- A- is a part of the circulatory system
- B- contains red blood cells
- C- its vessels are one-way that transport the fluid it contains from the tissues to the heart
- D- contains lymphocytes

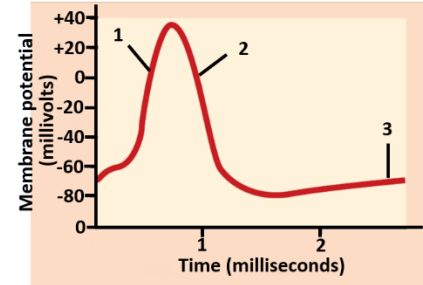

28-Which structures of the adjacent figure are **NOT** within the path taken by the sperm as they leave the body?

- A- 2, 3, 5
- B- 2, 3, 4
- C- 1, 2, 5
- D- 1, 2, 4

29- Which point on the graph represents when the voltage-gated sodium channels are open?

- A- only 1
- B- 1 and 3
- C- only 3
- D- 2 and 3

30-Which of the following is correct regarding the Langerhans Islands?

- A- secrete two amino acid-based hormones that lower the blood sugar level
- B- contain mostly exocrine cells
- C- function as an endocrine gland.
- D- all of them are correct

31-Which of the following pairs are correctly matched? A- macrophages : display antigens on its surface

- B- complement system proteins : are released by cells infected with virus
- C- stomach acids : are specific defenses
- D- thymus : helps produce all kinds of lymphocytes.

32-Which of the following often results in addiction?

- A- tolerance
- B- withdrawal
- C- dependence
- D- effective dose

33-Which of the following does **NOT** occur during the first trimester of pregnancy?

- A- the legs, eyes, and ears have begun to develop
- B- the fetus can react to loud sounds.
- C- fingers are formed.
- D- the heart begins to beat.

34-In phase II of HIV infection, all of the following occur **EXCEPT** :-

- A- the virus continues to replicate.
- B- helper T cells can no longer stimulate B cells.
- C- B cells continue to make a large amount of antibody against HIV
- D- The number of helper T cells drops steadily

35-One of the following is secreted by a ductal gland:-

- A- aldosterone
- B- human chorionic gonadotropin
- C- cortisol
- D- lysozyme

36-In this blood transfusion process $AB^+ \longrightarrow O^-$:-

(1- anti-Rh antibodies will react with Rh antigens ,2- anti-A antibodies will react with A antigens, 3- anti-B antibodies will react with B antigens)

- A- 1 , 2
- B- 1 , 2 , 3,
- C- 1 , 3
- D- 2 , 3

37-Which of the following is correct about red blood cells?

- A- immature red blood cells synthesize large amounts of hemoglobin
- B- their cell nucleus and organelles disintegrate
- C- they form antibodies
- D- both (A and B) are correct

38-Which of the following is **incorrect** for a relaxed muscle?

- A- the length of the actin and the myosin filaments does not change in comparison to a contracted muscle
- B- the actin and myosin filaments overlap
- C- the actin and myosin filaments slide past each other
- D- all of them are incorrect.

39-When the, in the blood the sensors in the brain send a message to the respiratory muscles to return to a slower breathing rate.

- A- carbon dioxide concentration decreases
- B- carbon dioxide concentration increases
- C- the oxygen and carbon dioxide concentration increase
- D- the oxygen concentration decreases

40-In which of the following states of the monohybrid crosses ,50% of the resulting individuals are recessive?

- A- If both parents are homozygous and dominant
- B- If one of the parents is recessive and the other is heterozygous
- C- If one of the parents is homozygous and dominant and the other is heterozygous
- D- If both parents are heterozygous

41-In complete dominance the trait of smooth seeds appears when its genotype is.....,but the trait of the terminal flower appears when its genotype is.....

- A- only homozygous, only heterozygous
- B- only heterozygous, only homozygous
- C- homozygous or heterozygous, only homozygous
- D- only heterozygous, homozygous or heterozygous

42-In each replication fork there are:-

- A- two helicases and one DNA polymerase
- B- one helicase and two DNA polymerases
- C- one helicase and one DNA polymerase
- D- two helicases and two DNA polymerases

43-Based on the adjacent table, that shows the ratio of nitrogen bases in humans, virus X, and wheat, which of the following choices is correct:

	Adenine(A)	Thymine(T)	Guanine(G)	Cytosine(C)
Human	30.4	30.1	19.6	19.9
X virus	34.2	25.8	13.8	26.2
Wheat	27.3	27.1	22.7	22.8

- A- DNA in X virus is single-stranded DNA
- B- DNA in human, X virus, and wheat are in the form of a double helix. .
- C- the ratio of purines to pyrimidines in human, X virus and wheat is 1:1.
- D- all of them are correct

44-Avery and his colleagues' experiments found that the cells.....unable to convert R cells into S cells.

- A- missing DNA
- B- containing DNA
- C- missing protein
- D- missing RNA

45-Considering the three components of a nucleotide, how many nucleotides are identical (which have the exact same structure) in both DNA and RNA?

- A- zero
- B- 2
- C- 3
- D- 4

46-In which of the following crosses the ratio of genotype and the ratio of phenotype of the resulting individuals are equal?

- A- the cross between two heterozygous individuals in incomplete dominance
- B- monohybrid cross between two heterozygous individuals in complete dominance
- C- dihybrid cross between two homozygous individuals for both characteristics in complete dominance
- D- both (A and C) are correct

47-If the probability that a specific trait will appear in a generation is ($\frac{3}{16}$) and the number of individuals for this trait is (300) individuals, what is the total number of individuals in this generation?

- A- 300 individuals
- B- 800 individuals
- C- 1600 individuals
- D- 2400 individuals

48-Which of the following represents the sequence that was used to transcribed this sequence (CUC AAG UGC UUC) of mRNA?

- A- CUCAAGUGCUUC
- B- GAGUUCACGAAG
- C- GAGTTCACGAAG
- D- AGACCTGTAGGA

49-Which of the following is **INCORRECT**?

- A- the codon AUG specifies the amino acid methionine in genetic code.
- B- the number of anti-codons is 61 anti-codons.
- C- the number of codons that specify amino acids is 61 codons
- D- the codon GCU, which specifies the amino acid alanine in genetic code, can specify another different amino acid

50- In the process of DNA replication: -

- A-the number of purines in one of the new strands is equal to the number of pyrimidines in the other new strand
- B-the number of pyrimidines in one of the new strands is equal to the number of pyrimidines in the other new strand
- C-each original strand serves as a template to make an identical strand as itself
- D- both (A and C) are correct

Note: choose the correct answer:

(2 marks for each right answer)

1-Both natural killer cells and inhibitory T cells

A- are white blood cells.

C- carry antigens of pathogen on their surfaces

B- play a part in humoral immune response.

D- both (A and C) are correct

2-What is the role of the follicle-stimulating hormone in humans?

A- along with testosterone, stimulates sperm production

C- stimulates cell division in a follicle

B- stimulates the secretion of testosterone

D- both (A and C) are correct

3-Which of the following is incorrect?

(1- Only artery carries oxygenated blood, 2- The artery and the vein both have an inner layer of endothelial tissue, 3- The artery divides into smaller blood vessels until they end in capillaries, 4- Only vein carries deoxygenated blood).

A- 1, 3, 4

B- 1, 4

C- 1, 2, 4

D-2, 3, 4

4-Which of the following is correct regarding the Langerhans Islands?

A- secrete two amino acid-based hormones that lower the blood sugar level

B- contain mostly exocrine cells

C- function as an endocrine gland.

D- all of them are correct

5-How many different genotypes can result from a dihybrid cross between two pea plants? If you know that one plant is a heterozygous of both traits and the other is unknown genotype, and that the ratio of heterozygous individuals for the two traits resulting from this cross is 25%.

A- 2

B- 4

C- 8

D- all of them are incorrect

6-The male reproductive system structure that lies between the bladder and the rectum, produces a fluid: -

A- rich in sugars

B- that neutralizes the acids in the female reproductive system

C- that neutralizes traces of acidic urine in the urethra

D- all of them are incorrect

7-The cardiovascular system differs from the lymphatic system in that the cardiovascular system:

A- is a part of the circulatory system

B- contains red blood cells

C- its vessels are one-way that transport the fluid it contains from the tissues to the heart

D- contains lymphocytes

8-Uterus contains target cells for which of the following hormones?

A- estrogen

B- progesterone

C- oxytocin

D- all of them are correct

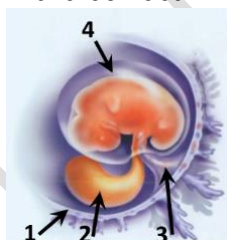

9- In the adjacent figure, which number points to the membrane that surrounds all of the other embryonic membranes ?

A- 1

B- 2

C- 3

D- 4

10-In phase II of HIV infection, all of the following occur EXCEPT:-

A- the virus continues to replicate.

B- helper T cells can no longer stimulate B cells.

C- B cells continue to make a large amount of antibody against HIV

D- The number of helper T cells drops steadily

11-Depending on the adjacent figure, all blood vessels

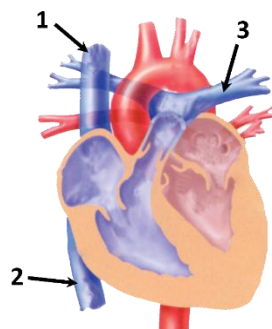

that are labeled by numbers 1, 2, 3: -

A- are veins

B- carry deoxygenated blood to the heart

C- their walls are made up of three layers

D- both (A and C) are correct

12-Which of the following is correct regarding the Schwann cell?

A- transmits nerve impulses from the cell body towards the nerve endings

B- produces the myelin around the axon of neurons that are not found in the brain or in the spinal cord

C- receives stimuli from other neurons and transmits them towards the nerve endings

D- produces the myelin around the axon of all neurons

13-In the axial skeleton, the red bone marrow is found in the:-

A- scapula

B- clavicle

C- sternum

D- both (B and C) are correct

14-In this blood transfusion process $AB^+ \rightarrow O^-$:-

(1- anti-Rh antibodies will react with Rh antigens ,2- anti-A antibodies will react with A antigens, 3- anti-B antibodies will react with B antigens)

A- 1, 2

B- 1, 2, 3,

C- 1, 3

D-2, 3

15-Which of the following is incorrect for a relaxed muscle?

A- the length of the actin and the myosin filaments does not change in comparison to a contracted muscle

B- the actin and myosin filaments overlap

C- the actin and myosin filaments slide past each other

D- all of them are incorrect.

16-Which of the following is a function of the long bone:

A- its ability to contract and relax enables the body to move

B- produces platelets

C- helps the body to maintain a constant temperature

D- all of them are correct

17-Which of the following does NOT occur during the first trimester of pregnancy?

A- the legs, eyes, and ears have begun to develop

B- the fetus can react to loud sounds.

C- fingers are formed.

D- the heart begins to beat.

18-Which of the following is correct regarding the cerebellum?

A- it lies below and before the cerebral hemispheres

B- the surface of cerebellum is highly folded

C- It receives motor impulses coming from the ears

D- all of them are correct

19-Which of the following pairs are correctly matched? A- macrophages : display antigens on its surface

B- complement system proteins : are released by cells infected with virus

C- stomach acids : are specific defenses D- thymus : helps produce all kinds of lymphocytes.

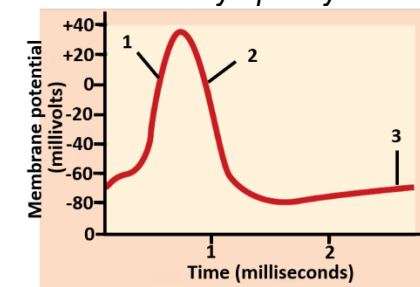

20- Which point on the graph represents when the voltage-gated sodium channels are open?

A- only 1

B- 1 and 3

C- only 3

D- 2 and 3

21-Which of the following are the characteristics of the atrioventricular node?

(1- It is located in the septum between the two ventricles, 2- it relays the electrical impulse to the muscle cells that make up the ventricles, 3- it regulates the rate of contraction of the entire heart, 4- it initiates an electrical impulse and causes a QRS wave in the electrocardiograph(ECG))

A- 1, 3, 4

B- 2, 4

C- 1, 2, 4

D- 2, 3, 4

22-Epiphyseal plate is NOT found at the ends of immature: -.

A- fibula bone

B- skull bones

C- humerus bone

D- tibia bone

23-Plasma cells: -

A- secrete antibodies

B- create holes in the membranes of the infected cells

C- make antibodies

D- both (A and C) are correct

24-In the process of hearing which of the following releases neurotransmitters?

A- the hair cells

B- the fluid inside the cochlea

C- the membrane that covers the hair cells

D- the bottom membrane of the middle chamber

25-All of the following are correct about chemical receptors, EXCEPT:

A- are neurons that detect stimuli

B- are clustered in taste buds

C- are found in the mucous lining of the epithelium in the nasal passages

D-the action potentials they produce are interpreted only in the parietal lobe of the cerebral cortex

26-When the, in the blood the sensors in the brain send a message to the respiratory muscles to return to a slower breathing rate.

- A- carbon dioxide concentration decreases B- carbon dioxide concentration increases
C- the oxygen and carbon dioxide concentration increase D- the oxygen concentration decreases

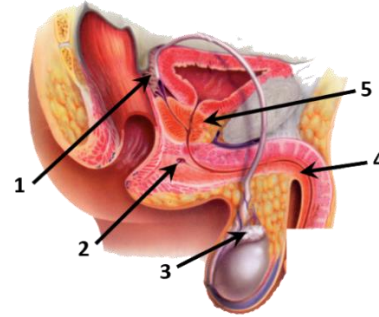

27-Tobacco: -

- A- contains no substance that causes addiction B- causes chronic bronchitis
C- burning of it produces tars that paralyzes the cilia that line the respiratory tracts D- both (B and C) are correct

28-Which structures of the adjacent figure are **NOT** within the path taken

by the sperm as they leave the body?

- A- 2, 3, 5
B- 2, 3, 4
C- 1, 2, 5
D- 1, 2, 4

29-Opportunistic infections: -

- A- can be considered as evidence that the HIV infection has progressed to AIDS
B- the organisms of these diseases usually do not create problems in people with a healthy immune system
C- appear in phase I of HIV infection D- both (A and B) are correct

30-One of the following is secreted by a ductal gland:-

- A- aldosterone B- human chorionic gonadotropin C- cortisol D- lysozyme

31-Which of the following often results in addiction?

- A- tolerance B- withdrawal C- dependence D- effective dose

32-The similarity between the mechanism of action of amino acid-based hormones and the mechanism of action of thyroid hormones is that both mechanisms need to: -

- A- target cell B- second messenger C- bind to its own receptor D- both (A and C) are correct

33-The smooth muscle differs from the skeletal muscle in that the smooth muscle: -

- A- has origin and insertion points B- is striated C- forms the walls of the internal organs D- is voluntary

34-In skeletal muscle the tissue that bounds together a group of fascicles is a(an): -

- A- epithelial tissues B- nervous tissue C- muscle tissue D- connective tissue

35-Which of the following directs most incoming sensory signals to the proper region of the cerebral cortex:

- A- midbrain B- medulla oblongata C- pons D- thalamus

36- The adjacent figure shows which of the following?

- A- a Haversian canal that is surrounded by lamellae in compact bone.
B- a spongy bone that has a latticework structure.
C- a periosteum that contains a network of blood vessels.
D- a long bone cavity that contains the yellow bone marrow.

37-Which of the following is correct about red blood cells?

- A- immature red blood cells synthesize large amounts of hemoglobin
B- their cell nucleus and organelles disintegrate C- they form antibodies D- both (A and B) are correct

38-In the primary and secondary immune responses: -

- A- memory cells are produced B- antibodies are produced
C- antigens are attacked D- all of them are correct

39-During inspiration, the diaphragm....., causing the air pressure inside the lungsthan the air pressure outside the body: -

- A- flattens, lower B- contracts, higher
C- relaxes, lower D- flattens, higher

40-In which of the following states of the monohybrid crosses ,50% of the resulting individuals are recessive?

- A- If both parents are homozygous and dominant
B- If one of the parents is recessive and the other is heterozygous
C- If one of the parents is homozygous and dominant and the other is heterozygous
D- If both parents are heterozygous

41-If the probability that a specific trait will appear in a generation is ($\frac{3}{16}$) and the number of individuals for this trait is (300) individuals, what is the total number of individuals in this generation?

- A- 300 individuals B- 800 individuals C- 1600 individuals D- 2400 individuals

42-In each replication fork there are:-

- A- two helicases and one DNA polymerase B- one helicase and two DNA polymerases
C- one helicase and one DNA polymerase D- two helicases and two DNA polymerases

43-In complete dominance the trait of smooth seeds appears when its genotype is.....,but the trait of the terminal flower appears when its genotype is.....

- A- only homozygous, only heterozygous B- only heterozygous, only homozygous
C- homozygous or heterozygous, only homozygous D- only heterozygous, homozygous or heterozygous

44- In the process of DNA replication: -

- A-the number of purines in one of the new strands is equal to the number of pyrimidines in the other new strand
B-the number of pyrimidines in one of the new strands is equal to the number of pyrimidines in the other new strand
C-each original strand serves as a template to make an identical strand as itself D- both (A and C) are correct

45-Considering the three components of a nucleotide, how many nucleotides are identical (which have the exact same structure) in both DNA and RNA?

- A- zero B- 2 C- 3 D- 4

46-Avery and his colleagues' experiments found that the cells.....unable to convert R cells into S cells.

- A- missing DNA B- containing DNA C- missing protein D- missing RNA

47-In which of the following crosses the ratio of genotype and the ratio of phenotype of the resulting individuals are equal?

- A- the cross between two heterozygous individuals in incomplete dominance
B- monohybrid cross between two heterozygous individuals in complete dominance
C- dihybrid cross between two homozygous individuals for both characteristics in complete dominance
D- both (A and C) are correct

48-Which of the following represents the sequence that was used to transcribed this sequence (CUC AAG UGC UUC) of mRNA?

- A- CUCAAGUGCUUC B- GAGUUCACGAAG C- GAGTTCACGAAG D- AGACCTGTAGGA

49-Based on the adjacent table, that shows the ratio of nitrogen bases in humans, virus X, and wheat, which of the following choices is correct:

	Adenine(A)	Thymine(T)	Guanine(G)	Cytosine(C)
Human	30.4	30.1	19.6	19.9
X virus	34.2	25.8	13.8	26.2
Wheat	27.3	27.1	22.7	22.8

- A- DNA in X virus is single-stranded DNA
B- DNA in human, X virus, and wheat are in the form of a double helix. .
C- the ratio of purines to pyrimidines in human, X virus and wheat is 1:1.
D- all of them are correct

50-Which of the following is **INCORRECT**?

- A- the codon AUG specifies the amino acid methionine in genetic code.
B- the number of anti-codons is 61 anti-codons.
C- the number of codons that specify amino acids is 61 codons
D- the codon GCU, which specifies the amino acid alanine in genetic code, can specify another different amino acid

Note: choose the correct answer:

(2 marks for each right answer)

1-How many different genotypes can result from a dihybrid cross between two pea plants? If you know that one plant is a heterozygous of both traits and the other is unknown genotype, and that the ratio of heterozygous individuals for the two traits resulting from this cross is 25%.

- A- 2 B- 4 C- 8 D- all of them are incorrect

2-Which of the following is correct regarding the Schwann cell?

- A- transmits nerve impulses from the cell body towards the nerve endings
B- produces the myelin around the axon of neurons that are not found in the brain or in the spinal cord
C- receives stimuli from other neurons and transmits them towards the nerve endings
D- produces the myelin around the axon of all neurons

3-Which of the following often results in addiction?

- A- tolerance B- withdrawal C- dependence D- effective dose

4-Which of the following is correct regarding the cerebellum?

- A- it lies below and before the cerebral hemispheres B- the surface of cerebellum is highly folded
C- It receives motor impulses coming from the ears D- all of them are correct

5-Which of the following is correct regarding the Langerhans Islands?

- A- secrete two amino acid-based hormones that lower the blood sugar level
B- contain mostly exocrine cells C- function as an endocrine gland. D- all of them are correct

6-What is the role of the follicle-stimulating hormone in humans?

- A- along with testosterone, stimulates sperm production B- stimulates the secretion of testosterone
C- stimulates cell division in a follicle D- both (A and C) are correct

7-All of the following are correct about chemical receptors, **EXCEPT**:

- A- are neurons that detect stimuli B- are clustered in taste buds
C- are found in the mucous lining of the epithelium in the nasal passages
D- the action potentials they produce are interpreted only in the parietal lobe of the cerebral cortex

8-The male reproductive system structure that lies between the bladder and the rectum, produces a fluid: -

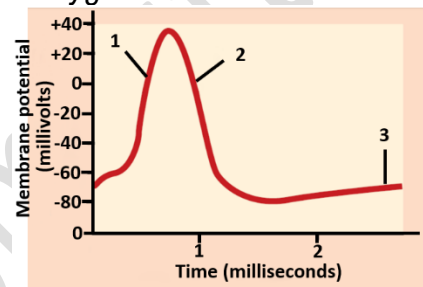

- A- rich in sugars B- that neutralizes the acids in the female reproductive system
C- that neutralizes traces of acidic urine in the urethra D- all of them are incorrect

9-When the, in the blood the sensors in the brain send a message to the respiratory muscles to return to a slower breathing rate.

- A- carbon dioxide concentration decreases B- carbon dioxide concentration increases
C- the oxygen and carbon dioxide concentration increase D- the oxygen concentration decreases

10- Which point on the graph represents when the voltage-gated sodium channels are open?

- A- only 1
B- 1 and 3
C- only 3
D- 2 and 3

11-In this blood transfusion process $AB^+ \rightarrow O^-$:-

(1- anti-Rh antibodies will react with Rh antigens ,2- anti-A antibodies will react with A antigens, 3- anti-B antibodies will react with B antigens)

- A- 1 , 2 B- 1 , 2 , 3, C- 1 , 3 D-.2 , 3

12- The adjacent figure shows which of the following?

- A- a Haversian canal that is surrounded by lamellae in compact bone.
B- a spongy bone that has a latticework structure.
C- a periosteum that contains a network of blood vessels.
D- a long bone cavity that contains the yellow bone marrow.

13-In skeletal muscle the tissue that bounds together a group of fascicles is a(an): -

- A- epithelial tissues B- nervous tissue C- muscle tissue D- connective tissue

14-Plasma cells: -

- A- secrete antibodies B- create holes in the membranes of the infected cells
C- make antibodies D- both (A and C) are correct

15-The similarity between the mechanism of action of amino acid-based hormones and the mechanism of action of thyroid hormones is that both mechanisms need to: -

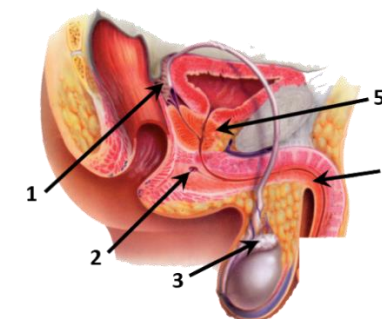

- A- target cell B- second messenger C- bind to its own receptor D- both (A and C) are correct

16-Which of the following does **NOT** occur during the first trimester of pregnancy?

- A- the legs, eyes, and ears have begun to develop B- the fetus can react to loud sounds.
C- fingers are formed. D- the heart begins to beat.

17-Which structures of the adjacent figure are **NOT** within the path taken by the sperm as they leave the body?

- A- 2, 3, 5
B- 2, 3, 4
C- 1, 2, 5
D- 1, 2, 4

18-Which of the following pairs are correctly matched? A- macrophages : display antigens on its surface

- B- complement system proteins : are released by cells infected with virus
C- stomach acids : are specific defenses D- thymus : helps produce all kinds of lymphocytes.

19-In the primary and secondary immune responses: -

- A- memory cells are produced B- antibodies are produced
C- antigens are attacked D- all of them are correct

20-During inspiration, the diaphragm....., causing the air pressure inside the lungsthan the air pressure outside the body: -

- A- flattens, lower B- contracts, higher
C- relaxes, lower D- flattens, higher

21-In the axial skeleton, the red bone marrow is found in the:-

- A- scapula B- clavicle C- sternum D- both (B and C) are correct

22-Tobacco: -

- A- contains no substance that causes addiction B- causes chronic bronchitis
C- burning of it produces tars that paralyzes the cilia that line the respiratory tracts D- both (B and C) are correct

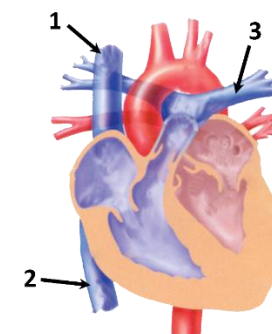

23-The cardiovascular system differs from the lymphatic system in that the cardiovascular system:

- A- is a part of the circulatory system B- contains red blood cells
C- its vessels are one-way that transport the fluid it contains from the tissues to the heart
D- contains lymphocytes

24-Depending on the adjacent figure, all blood vessels

that are labeled by numbers 1, 2, 3: -

- A- are veins
B- carry deoxygenated blood to the heart
C- their walls are made up of three layers
D- both (A and C) are correct

25-Uterus contains target cells for which of the following hormones?

- A- estrogen B- progesterone C- oxytocin D- all of them are correct

26-In phase II of HIV infection, all of the following occur **EXCEPT**: -

- A- the virus continues to replicate. B- helper T cells can no longer stimulate B cells.
C- B cells continue to make a large amount of antibody against HIV
D- The number of helper T cells drops steadily

27-Which of the following is correct about red blood cells?

- A-** immature red blood cells synthesize large amounts of hemoglobin
B- their cell nucleus and organelles disintegrate **C-** they form antibodies **D-** both (A and B) are correct

28-Which of the following is **incorrect** for a relaxed muscle?

- A-** the length of the actin and the myosin filaments does not change in comparison to a contracted muscle
B- the actin and myosin filaments overlap **C-** the actin and myosin filaments slide past each other
D- all of them are incorrect.

29-Which of the following are the characteristics of the atrioventricular node?

- (1- It is located in the septum between the two ventricles, 2- it relays the electrical impulse to the muscle cells that make up the ventricles, 3- it regulates the rate of contraction of the entire heart, 4- it initiates an electrical impulse and causes a QRS wave in the electrocardiograph(ECG))

- A-** 1, 3, 4 **B-** 2, 4 **C-** 1, 2, 4 **D-** 2, 3, 4

30-Both natural killer cells and inhibitory T cells

- A-** are white blood cells. **B-** play a part in humoral immune response.
C- carry antigens of pathogen on their surfaces **D-** both (A and C) are correct

31-Which of the following is **incorrect**?

- (1- Only artery carries oxygenated blood, 2- The artery and the vein both have an inner layer of endothelial tissue, 3- The artery divides into smaller blood vessels until they end in capillaries, 4- Only vein carries deoxygenated blood).

- A-** 1, 3, 4 **B-** 1, 4 **C-** 1, 2, 4 **D-** 2, 3, 4

32-Epiphyseal plate is **NOT** found at the ends of immature: -.

- A-** fibula bone **B-** skull bones **C-** humerus bone **D-** tibia bone

33-Which of the following is a function of the long bone:

- A-** its ability to contract and relax enables the body to move **B-** produces platelets
C- helps the body to maintain a constant temperature **D-** all of them are correct

34-One of the following is secreted by a ductal gland:-

- A-** aldosterone **B-** human chorionic gonadotropin **C-** cortisol **D-** lysozyme

35-The smooth muscle differs from the skeletal muscle in that the smooth muscle: -

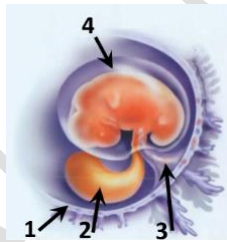

- A-** has origin and insertion points **B-** is striated **C-** forms the walls of the internal organs **D-** is voluntary

36-In the process of hearing which of the following releases neurotransmitters?

- A-** the hair cells **B-** the fluid inside the cochlea
C- the membrane that covers the hair cells **D-** the bottom membrane of the middle chamber

37- In the adjacent figure, which number points to the membrane that surrounds all of the other embryonic membranes ?

- A-** 1
B- 2
C- 3
D- 4

38-Opportunistic infections: -

- A-** can be considered as evidence that the HIV infection has progressed to AIDS
B- the organisms of these diseases usually do not create problems in people with a healthy immune system
C- appear in phase I of HIV infection **D-** both (A and B) are correct

39-Which of the following directs most incoming sensory signals to the proper region of the cerebral cortex:

- A-** midbrain **B-** medulla oblongata **C-** pons **D-** thalamus

40-In which of the following states of the monohybrid crosses ,50% of the resulting individuals are recessive?

- A-** If both parents are homozygous and dominant
B- If one of the parents is recessive and the other is heterozygous
C- If one of the parents is homozygous and dominant and the other is heterozygous
D- If both parents are heterozygous

41- In the process of DNA replication: -

- A-** the number of purines in one of the new strands is equal to the number of pyrimidines in the other new strand
B- the number of pyrimidines in one of the new strands is equal to the number of pyrimidines in the other new strand
C- each original strand serves as a template to make an identical strand as itself **D-** both (A and C) are correct

42-Based on the adjacent table, that shows the ratio of nitrogen bases in humans, virus X, and wheat, which of the following choices is correct:

	Adenine(A)	Thymine(T)	Guanine(G)	Cytosine(C)
Human	30.4	30.1	19.6	19.9
X virus	34.2	25.8	13.8	26.2
Wheat	27.3	27.1	22.7	22.8

- A-** DNA in X virus is single-stranded DNA
B- DNA in human, X virus, and wheat are in the form of a double helix. .
C- the ratio of purines to pyrimidines in human, X virus and wheat is 1:1.
D- all of them are correct

43-Avery and his colleagues' experiments found that the cells.....unable to convert R cells into S cells.

- A-** missing DNA **B-** containing DNA **C-** missing protein **D-** missing RNA

44-Which of the following is **INCORRECT**?

- A-** the codon AUG specifies the amino acid methionine in genetic code.
B- the number of anti-codons is 61 anti-codons.
C- the number of codons that specify amino acids is 61 codons
D- the codon GCU, which specifies the amino acid alanine in genetic code, can specify another different amino acid

45-Considering the three components of a nucleotide, how many nucleotides are identical (which have the exact same structure) in both DNA and RNA?

- A-** zero **B-** 2 **C-** 3 **D-** 4

46-In which of the following crosses the ratio of genotype and the ratio of phenotype of the resulting individuals are equal?

- A-** the cross between two heterozygous individuals in incomplete dominance
B- monohybrid cross between two heterozygous individuals in complete dominance
C- dihybrid cross between two homozygous individuals for both characteristics in complete dominance
D- both (A and C) are correct

47-In complete dominance the trait of smooth seeds appears when its genotype is.....,but the trait of the terminal flower appears when its genotype is.....

- A-** only homozygous, only heterozygous **B-** only heterozygous, only homozygous
C- homozygous or heterozygous, only homozygous **D-** only heterozygous, homozygous or heterozygous

48-In each replication fork there are:-

- A-** two helicases and one DNA polymerase **B-** one helicase and two DNA polymerases
C- one helicase and one DNA polymerase **D-** two helicases and two DNA polymerases

49-Which of the following represents the sequence that was used to transcribed this sequence (CUC AAG UGC UUC) of mRNA?

- A-** CUCAAGUGCUUC **B-** GAGUUCACGAAG **C-** GAGTTCACGAAG **D-** AGACCTGTAGGA

50-If the probability that a specific trait will appear in a generation is ($\frac{3}{16}$) and the number of individuals for this trait is (300) individuals, what is the total number of individuals in this generation?

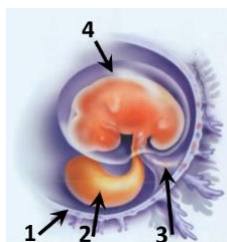

- A-** 300 individuals **B-** 800 individuals **C-** 1600 individuals **D-** 2400 individuals

Note: choose the correct answer: (2 marks for each right answer)

1- In the adjacent figure, which number points to the membrane that surrounds all of the other embryonic membranes ?

- A- 1
B- 2
C- 3
D- 4

2-The male reproductive system structure that lies between the bladder and the rectum, produces a fluid: -

- A- rich in sugars
B- that neutralizes the acids in the female reproductive system
C- that neutralizes traces of acidic urine in the urethra
D- all of them are incorrect

3-Which of the following is **incorrect** for a relaxed muscle?

- A- the length of the actin and the myosin filaments does not change in comparison to a contracted muscle
B- the actin and myosin filaments overlap
C- the actin and myosin filaments slide past each other
D- all of them are incorrect.

4-In this blood transfusion process $AB^+ \longrightarrow O^-$:-

(1- anti-Rh antibodies will react with Rh antigens ,2- anti-A antibodies will react with A antigens, 3- anti-B antibodies will react with B antigens)

- A- 1 , 2
B- 1 , 2 , 3,
C- 1 , 3
D- 2 , 3

5-The similarity between the mechanism of action of amino acid-based hormones and the mechanism of action of thyroid hormones is that both mechanisms need to: -

- A- target cell
B- second messenger
C- bind to its own receptor
D- both (A and C) are correct

6-Which of the following is **incorrect**?

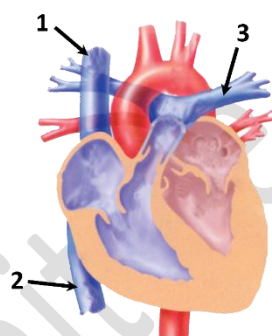

(1- Only artery carries oxygenated blood, 2- The artery and the vein both have an inner layer of endothelial tissue, 3- The artery divides into smaller blood vessels until they end in capillaries, 4- Only vein carries deoxygenated blood).

- A- 1, 3, 4
B- 1, 4
C- 1, 2, 4
D- 2, 3, 4

7-Depending on the adjacent figure, all blood vessels

that are labeled by numbers 1, 2, 3: -

- A- are veins
B- carry deoxygenated blood to the heart
C- their walls are made up of three layers
D- both (A and C) are correct

8-In the primary and secondary immune responses: -

- A- memory cells are produced
B- antibodies are produced
C- antigens are attacked
D- all of them are correct

9-All of the following are correct about chemical receptors, **EXCEPT**:

- A- are neurons that detect stimuli
B- are clustered in taste buds
C- are found in the mucous lining of the epithelium in the nasal passages
D- the action potentials they produce are interpreted only in the parietal lobe of the cerebral cortex

10-Which of the following is correct about red blood cells?

- A- immature red blood cells synthesize large amounts of hemoglobin
B- their cell nucleus and organelles disintegrate
C- they form antibodies
D- both (A and B) are correct

11-Plasma cells: -

- A- secrete antibodies
B- create holes in the membranes of the infected cells
C- make antibodies
D- both (A and C) are correct

12-Both natural killer cells and inhibitory T cells

- A- are white blood cells.
B- play a part in humoral immune response.
C- carry antigens of pathogen on their surfaces
D- both (A and C) are correct

13-What is the role of the follicle-stimulating hormone in humans?

- A- along with testosterone, stimulates sperm production
B- stimulates the secretion of testosterone
C- stimulates cell division in a follicle
D- both (A and C) are correct

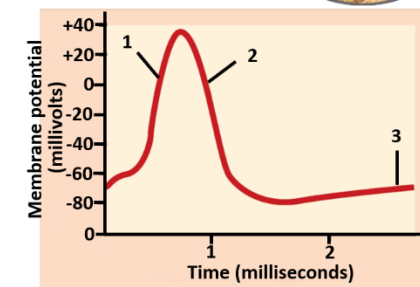

14- The adjacent figure shows which of the following?

- A- a Haversian canal that is surrounded by lamellae in compact bone.
B- a spongy bone that has a latticework structure.
C- a periosteum that contains a network of blood vessels.
D- a long bone cavity that contains the yellow bone marrow.

15- Which point on the graph represents when the voltage-gated sodium channels are open?

- A- only 1
B- 1 and 3
C- only 3
D- 2 and 3

16-Which of the following is correct regarding the Schwann cell?

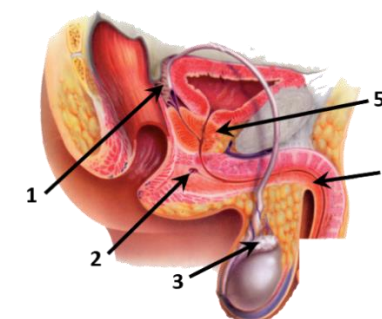

- A- transmits nerve impulses from the cell body towards the nerve endings
B- produces the myelin around the axon of neurons that are not found in the brain or in the spinal cord
C- receives stimuli from other neurons and transmits them towards the nerve endings
D- produces the myelin around the axon of all neurons

17-Which of the following directs most incoming sensory signals to the proper region of the cerebral cortex:

- A- midbrain
B- medulla oblongata
C- pons
D- thalamus

18-Which structures of the adjacent figure are **NOT** within the path taken by the sperm as they leave the body?

- A- 2, 3, 5
B- 2, 3, 4
C- 1, 2, 5
D- 1, 2, 4

19-In the axial skeleton, the red bone marrow is found in the:-

- A- scapula
B- clavicle
C- sternum
D- both (B and C) are correct

20-In skeletal muscle the tissue that bounds together a group of fascicles is a(an): -

- A- epithelial tissues
B- nervous tissue
C- muscle tissue
D- connective tissue

21-Uterus contains target cells for which of the following hormones?

- A- estrogen
B- progesterone
C- oxytocin
D- all of them are correct

22-How many different genotypes can result from a dihybrid cross between two pea plants? If you know that one plant is a heterozygous of both traits and the other is unknown genotype, and that the ratio of heterozygous individuals for the two traits resulting from this cross is 25%.

- A- 2
B- 4
C- 8
D- all of them are incorrect

23-Which of the following pairs are correctly matched? A- macrophages : display antigens on its surface

- B- complement system proteins : are released by cells infected with virus
C- stomach acids : are specific defenses
D- thymus : helps produce all kinds of lymphocytes.

24-The cardiovascular system differs from the lymphatic system in that the cardiovascular system:

- A- is a part of the circulatory system
B- contains red blood cells
C- its vessels are one-way that transport the fluid it contains from the tissues to the heart
D- contains lymphocytes

25-Tobacco: -

- A- contains no substance that causes addiction
B- causes chronic bronchitis
C- burning of it produces tars that paralyzes the cilia that line the respiratory tracts
D- both (B and C) are correct

- 26-**Which of the following does **NOT** occur during the first trimester of pregnancy?
A- the legs, eyes, and ears have begun to develop B- the fetus can react to loud sounds.
C- fingers are formed. D- the heart begins to beat.
- 27-**Which of the following is a function of the long bone:
A- its ability to contract and relax enables the body to move B- produces platelets
C- helps the body to maintain a constant temperature D- all of them are correct
- 28-**The smooth muscle differs from the skeletal muscle in that the smooth muscle: -
A- has origin and insertion points B- is striated C- forms the walls of the internal organs D- is voluntary
- 29-**Epiphyseal plate is **NOT** found at the ends of immature: -.
A- fibula bone B- skull bones C- humerus bone D- tibia bone
- 30-**Which of the following is correct regarding the Langerhans Islands?
A- secrete two amino acid-based hormones that lower the blood sugar level
B- contain mostly exocrine cells C- function as an endocrine gland. D- all of them are correct
- 31-**Which of the following is correct regarding the cerebellum?
A- it lies below and before the cerebral hemispheres B- the surface of cerebellum is highly folded
C- It receives motor impulses coming from the ears D- all of them are correct
- 32-**In phase II of HIV infection, all of the following occur **EXCEPT**: -
A- the virus continues to replicate. B- helper T cells can no longer stimulate B cells.
C- B cells continue to make a large amount of antibody against HIV
D- The number of helper T cells drops steadily
- 33-**One of the following is secreted by a ductal gland:-
A- aldosterone B- human chorionic gonadotropin C- cortisol D- lysozyme
- 34-**When the, in the blood the sensors in the brain send a message to the respiratory muscles to return to a slower breathing rate.
A- carbon dioxide concentration decreases B- carbon dioxide concentration increases
C- the oxygen and carbon dioxide concentration increase D- the oxygen concentration decreases
- 35-**Opportunistic infections: -
A- can be considered as evidence that the HIV infection has progressed to AIDS
B- the organisms of these diseases usually do not create problems in people with a healthy immune system
C- appear in phase I of HIV infection D- both (A and B) are correct
- 36-**In the process of hearing which of the following releases neurotransmitters?
A- the hair cells B- the fluid inside the cochlea
C- the membrane that covers the hair cells D- the bottom membrane of the middle chamber
- 37-**Which of the following often results in addiction?
A- tolerance B- withdrawal C- dependence D- effective dose
- 38-**During inspiration, the diaphragm....., causing the air pressure inside the lungsthan the air pressure outside the body: -
A- flattens, lower B- contracts, higher
C- relaxes, lower D- flattens, higher
- 39-**Which of the following are the characteristics of the atrioventricular node?
(1- It is located in the septum between the two ventricles, 2- it relays the electrical impulse to the muscle cells that make up the ventricles, 3- it regulates the rate of contraction of the entire heart, 4- it initiates an electrical impulse and causes a QRS wave in the electrocardiograph(ECG))
A- 1, 3, 4 B- 2, 4 C- 1, 2, 4 D- 2, 3, 4
- 40-**In which of the following states of the monohybrid crosses ,50% of the resulting individuals are recessive?
A- If both parents are homozygous and dominant
B- If one of the parents is recessive and the other is heterozygous
C- If one of the parents is homozygous and dominant and the other is heterozygous
D- If both parents are heterozygous
- 41-** In the process of DNA replication: -
A-the number of purines in one of the new strands is equal to the number of pyrimidines in the other new strand
B-the number of pyrimidines in one of the new strands is equal to the number of pyrimidines in the other new strand
C-each original strand serves as a template to make an identical strand as itself D- both (A and C) are correct

- 42-**Which of the following is **INCORRECT**?
A- the codon AUG specifies the amino acid methionine in genetic code.
B- the number of anti-codons is 61 anti-codons.
C- the number of codons that specify amino acids is 61 codons
D- the codon GCU, which specifies the amino acid alanine in genetic code, can specify another different amino acid
- 43-**Considering the three components of a nucleotide, how many nucleotides are identical (which have the exact same structure) in both DNA and RNA?
A- zero B- 2 C- 3 D- 4
- 44-**In each replication fork there are:-
A- two helicases and one DNA polymerase B- one helicase and two DNA polymerases
C- one helicase and one DNA polymerase D- two helicases and two DNA polymerases
- 45-**In complete dominance the trait of smooth seeds appears when its genotype is.....,but the trait of the terminal flower appears when its genotype is.....
A- only homozygous, only heterozygous B- only heterozygous, only homozygous
C- homozygous or heterozygous, only homozygous D- only heterozygous, homozygous or heterozygous
- 46-**Avery and his colleagues' experiments found that the cells.....unable to convert R cells into S cells.
A- missing DNA B- containing DNA C- missing protein D- missing RNA
- 47-**If the probability that a specific trait will appear in a generation is ($\frac{3}{16}$) and the number of individuals for this trait is (300) individuals, what is the total number of individuals in this generation?
A- 300 individuals B- 800 individuals C- 1600 individuals D- 2400 individuals
- 48-**In which of the following crosses the ratio of genotype and the ratio of phenotype of the resulting individuals are equal?
A- the cross between two heterozygous individuals in incomplete dominance
B- monohybrid cross between two heterozygous individuals in complete dominance
C- dihybrid cross between two homozygous individuals for both characteristics in complete dominance
D- both (A and C) are correct
- 49-**Which of the following represents the sequence that was used to transcribed this sequence (CUC AAG UGC UUC) of mRNA?
A- CUCAAGUGCUUC B- GAGUUCACGAAG C- GAGTTCACGAAG D- AGACCTGTAGGA
- 50-**Based on the adjacent table, that shows the ratio of nitrogen bases in humans, virus X, and wheat, which of the following choices is correct:
A- DNA in X virus is single-stranded DNA
B- DNA in human, X virus, and wheat are in the form of a double helix. .
C- the ratio of purines to pyrimidines in human, X virus and wheat is 1:1.
D- all of them are correct

	Adenine(A)	Thymine(T)	Guanine(G)	Cytosine(C)
Human	30.4	30.1	19.6	19.9
X virus	34.2	25.8	13.8	26.2
Wheat	27.3	27.1	22.7	22.8

Note: choose the correct answer:

(2 marks for each right answer)

1-Which of the following is **incorrect** for a relaxed muscle?

- A- the length of the actin and the myosin filaments does not change in comparison to a contracted muscle
B- the actin and myosin filaments overlap C- the actin and myosin filaments slide past each other
D- all of them are incorrect.

2-Which of the following is a function of the long bone:

- A- its ability to contract and relax enables the body to move B- produces platelets
C- helps the body to maintain a constant temperature D- all of them are correct

3-Plasma cells: - A- secrete antibodies B- create holes in the membranes of the infected cells

- C- make antibodies D- both (A and C) are correct

4-Tobacco: -

- A- contains no substance that causes addiction B- causes chronic bronchitis
C- burning of it produces tars that paralyzes the cilia that line the respiratory tracts D- both (B and C) are correct

5-Opportunistic infections: -

- A- can be considered as evidence that the HIV infection has progressed to AIDS
B- the organisms of these diseases usually do not create problems in people with a healthy immune system
C- appear in phase I of HIV infection D- both (A and B) are correct

6-All of the following are correct about chemical receptors, **EXCEPT**:

- A- are neurons that detect stimuli B- are clustered in taste buds
C- are found in the mucous lining of the epithelium in the nasal passages
D-the action potentials they produce are interpreted only in the parietal lobe of the cerebral cortex

7- The adjacent figure shows which of the following?

- A- a Haversian canal that is surrounded by lamellae in compact bone.
B- a spongy bone that has a latticework structure.
C- a periosteum that contains a network of blood vessels.
D- a long bone cavity that contains the yellow bone marrow.

8-When the, in the blood the sensors in the brain send a message to the respiratory muscles to return to a slower breathing rate.

- A- carbon dioxide concentration decreases B- carbon dioxide concentration increases
C- the oxygen and carbon dioxide concentration increase D- the oxygen concentration decreases

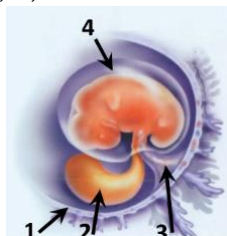

9-Which of the following is **incorrect**?

(1- Only artery carries oxygenated blood, 2- The artery and the vein both have an inner layer of endothelial tissue, 3- The artery divides into smaller blood vessels until they end in capillaries, 4- Only vein carries deoxygenated blood).

- A- 1, 3, 4 B- 1, 4 C- 1, 2, 4 D-2, 3, 4

10- In the adjacent figure, which number points to the membrane that surrounds all of the other embryonic membranes ?

- A- 1
B- 2
C- 3
D- 4

11-Both natural killer cells and inhibitory T cells

- A- are white blood cells. B- play a part in humoral immune response.
C- carry antigens of pathogen on their surfaces D- both (A and C) are correct

12-In the axial skeleton, the red bone marrow is found in the:-

- A- scapula B- clavicle C- sternum D- both (B and C) are correct

13-In the process of hearing which of the following releases neurotransmitters?

- A- the hair cells B- the fluid inside the cochlea
C- the membrane that covers the hair cells D- the bottom membrane of the middle chamber

14-Which of the following is correct regarding the Langerhans Islands?

- A- secrete two amino acid-based hormones that lower the blood sugar level
B- contain mostly exocrine cells C- function as an endocrine gland. D- all of them are correct

15-In skeletal muscle the tissue that bounds together a group of fascicles is a(an): -

- A- epithelial tissues B- nervous tissue C- muscle tissue D- connective tissue

16-One of the following is secreted by a ductal gland:-

- A- aldosterone B- human chorionic gonadotropin C- cortisol D- lysozyme

17-Which of the following are the characteristics of the atrioventricular node?

(1- It is located in the septum between the two ventricles, 2- it relays the electrical impulse to the muscle cells that make up the ventricles, 3- it regulates the rate of contraction of the entire heart, 4- it initiates an electrical impulse and causes a QRS wave in the electrocardiograph(ECG))

- A- 1, 3, 4 B- 2, 4 C- 1, 2, 4 D- 2, 3, 4

18-The cardiovascular system differs from the lymphatic system in that the cardiovascular system:

- A- is a part of the circulatory system B- contains red blood cells
C- its vessels are one-way that transport the fluid it contains from the tissues to the heart
D- contains lymphocytes

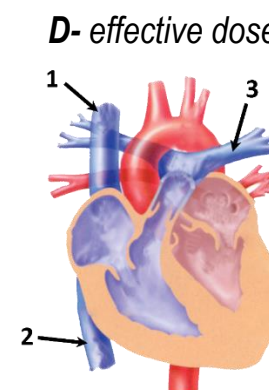

19-Which of the following often results in addiction?

- A- tolerance B- withdrawal C- dependence

20-Depending on the adjacent figure, all blood vessels

that are labeled by numbers 1, 2, 3: -

- A- are veins
B- carry deoxygenated blood to the heart
C- their walls are made up of three layers
D- both (A and C) are correct

21-Which of the following pairs are correctly matched?

- A- macrophages : display antigens on its surface
B- complement system proteins : are released by cells infected with virus
C- stomach acids : are specific defenses D- thymus : helps produce all kinds of lymphocytes.

22-What is the role of the follicle-stimulating hormone in humans?

- A- along with testosterone, stimulates sperm production B- stimulates the secretion of testosterone
C- stimulates cell division in a follicle D- both (A and C) are correct

23-In this blood transfusion process $AB^+ \longrightarrow O^-$:-

(1- anti-Rh antibodies will react with Rh antigens ,2- anti-A antibodies will react with A antigens, 3- anti-B antibodies will react with B antigens)

- A- 1, 2 B- 1, 2, 3, C- 1, 3 D-2, 3

24-Which of the following does **NOT** occur during the first trimester of pregnancy?

- A- the legs, eyes, and ears have begun to develop B- the fetus can react to loud sounds.
C- fingers are formed. D- the heart begins to beat.

25-Which of the following is correct regarding the cerebellum?

- A- it lies below and before the cerebral hemispheres B- the surface of cerebellum is highly folded
C- It receives motor impulses coming from the ears D- all of them are correct

26-How many different genotypes can result from a dihybrid cross between two pea plants? If you know that one plant is a heterozygous of both traits and the other is unknown genotype, and that the ratio of heterozygous individuals for the two traits resulting from this cross is 25%.

- A- 2 B- 4 C- 8 D- all of them are incorrect

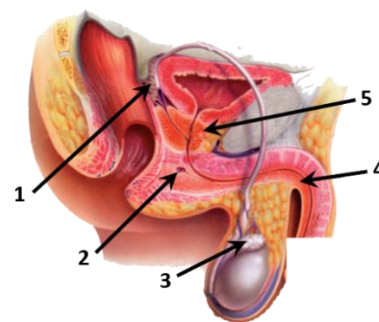

27-During inspiration, the diaphragm....., causing the air pressure inside the lungsthan the air pressure outside the body: -

- A- flattens, lower B- contracts, higher
C- relaxes, lower D- flattens, higher

28-Which structures of the adjacent figure are **NOT** within the path taken

by the sperm as they leave the body?

- A- 2, 3, 5
- B- 2, 3, 4
- C- 1, 2, 5
- D- 1, 2, 4

29-In phase II of HIV infection, all of the following occur **EXCEPT**:-

- A- the virus continues to replicate.
- B- helper T cells can no longer stimulate B cells.
- C- B cells continue to make a large amount of antibody against HIV
- D- The number of helper T cells drops steadily

30-Epiphyseal plate is **NOT** found at the ends of immature:-

- A- fibula bone
- B- skull bones
- C- humerus bone
- D- tibia bone

31-Uterus contains target cells for which of the following hormones?

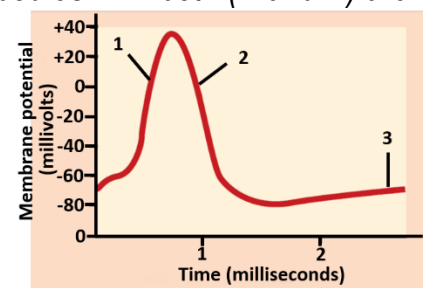

- A- estrogen
- B- progesterone
- C- oxytocin
- D- all of them are correct

32-Which of the following is correct about red blood cells?

- A- immature red blood cells synthesize large amounts of hemoglobin
- B- their cell nucleus and organelles disintegrate
- C- they form antibodies
- D- both (A and B) are correct

33- Which point on the graph represents when the voltage-gated sodium channels are open?

- A- only 1
- B- 1 and 3
- C- only 3
- D- 2 and 3

34-The male reproductive system structure that lies between the bladder and the rectum, produces a fluid:-

- A- rich in sugars
- B- that neutralizes the acids in the female reproductive system
- C- that neutralizes traces of acidic urine in the urethra
- D- all of them are incorrect

35-Which of the following is correct regarding the Schwann cell?

- A- transmits nerve impulses from the cell body towards the nerve endings
- B- produces the myelin around the axon of neurons that are not found in the brain or in the spinal cord
- C- receives stimuli from other neurons and transmits them towards the nerve endings
- D- produces the myelin around the axon of all neurons

36-The smooth muscle differs from the skeletal muscle in that the smooth muscle:-

- A- has origin and insertion points
- B- is striated
- C- forms the walls of the internal organs
- D- is voluntary

37-In the primary and secondary immune responses:-

- A- memory cells are produced
- B- antibodies are produced
- C- antigens are attacked
- D- all of them are correct

38-The similarity between the mechanism of action of amino acid-based hormones and the mechanism of action of thyroid hormones is that both mechanisms need to:-

- A- target cell
- B- second messenger
- C- bind to its own receptor
- D- both (A and C) are correct

39-Which of the following directs most incoming sensory signals to the proper region of the cerebral cortex:

- A- midbrain
- B- medulla oblongata
- C- pons
- D- thalamus

40-In which of the following states of the monohybrid crosses ,50% of the resulting individuals are recessive?

- A- If both parents are homozygous and dominant
- B- If one of the parents is recessive and the other is heterozygous
- C- If one of the parents is homozygous and dominant and the other is heterozygous
- D- If both parents are heterozygous

41-Considering the three components of a nucleotide, how many nucleotides are identical (which have the exact same structure) in both DNA and RNA?

- A- zero
- B- 2
- C- 3
- D- 4

42-Based on the adjacent table, that shows the ratio of nitrogen bases in humans, virus X, and wheat, which of the following choices is correct:

	Adenine(A)	Thymine(T)	Guanine(G)	Cytosine(C)
Human	30.4	30.1	19.6	19.9
X virus	34.2	25.8	13.8	26.2
Wheat	27.3	27.1	22.7	22.8

- A- DNA in X virus is single-stranded DNA
- B- DNA in human, X virus, and wheat are in the form of a double helix. .
- C- the ratio of purines to pyrimidines in human, X virus and wheat is 1:1.
- D- all of them are correct

43- In the process of DNA replication:-

- A-the number of purines in one of the new strands is equal to the number of pyrimidines in the other new strand
- B-the number of pyrimidines in one of the new strands is equal to the number of pyrimidines in the other new strand
- C-each original strand serves as a template to make an identical strand as itself
- D- both (A and C) are correct

44-Which of the following represents the sequence that was used to transcribed this sequence (CUC AAG UGC UUC) of mRNA?

- A- CUCAAGUGCUUC
- B- GAGUUCACGAAG
- C- GAGTTCACGAAG
- D- AGACCTGTAGGA

45-In each replication fork there are:-

- A- two helicases and one DNA polymerase
- B- one helicase and two DNA polymerases
- C- one helicase and one DNA polymerase
- D- two helicases and two DNA polymerases

46-In complete dominance the trait of smooth seeds appears when its genotype is.....,but the trait of the terminal flower appears when its genotype is.....

- A- only homozygous, only heterozygous
- B- only heterozygous, only homozygous
- C- homozygous or heterozygous, only homozygous
- D- only heterozygous, homozygous or heterozygous

47-Avery and his colleagues' experiments found that the cells.....unable to convert R cells into S cells.

- A- missing DNA
- B- containing DNA
- C- missing protein
- D- missing RNA

48-If the probability that a specific trait will appear in a generation is ($\frac{3}{16}$) and the number of individuals for this trait is (300) individuals, what is the total number of individuals in this generation?

- A- 300 individuals
- B- 800 individuals
- C- 1600 individuals
- D- 2400 individuals

49-Which of the following is **INCORRECT**?

- A- the codon AUG specifies the amino acid methionine in genetic code.
- B- the number of anti-codons is 61 anti-codons.
- C- the number of codons that specify amino acids is 61 codons
- D- the codon GCU, which specifies the amino acid alanine in genetic code, can specify another different amino acid

50-In which of the following crosses the ratio of genotype and the ratio of phenotype of the resulting individuals are equal?

- A- the cross between two heterozygous individuals in incomplete dominance
- B- monohybrid cross between two heterozygous individuals in complete dominance
- C- dihybrid cross between two homozygous individuals for both characteristics in complete dominance
- D- both (A and C) are correct

Note: choose the correct answer:

(2 marks for each right answer)

1-One of the following is secreted by a ductal gland:-

- A- aldosterone B- human chorionic gonadotropin C- cortisol D- lysozyme

2-How many different genotypes can result from a dihybrid cross between two pea plants? If you know that one plant is a heterozygous of both traits and the other is unknown genotype, and that the ratio of heterozygous individuals for the two traits resulting from this cross is 25%.

- A- 2 B- 4 C- 8 D- all of them are incorrect

3-Which of the following is **incorrect**?

(1- Only artery carries oxygenated blood, 2- The artery and the vein both have an inner layer of endothelial tissue, 3- The artery divides into smaller blood vessels until they end in capillaries, 4- Only vein carries deoxygenated blood).

- A- 1, 3, 4 B- 1, 4 C- 1, 2, 4 D- 2, 3, 4

4-Epiphyseal plate is **NOT** found at the ends of immature: -

- A- fibula bone B- skull bones C- humerus bone D- tibia bone

5-Both natural killer cells and inhibitory T cells

- A- are white blood cells. B- play a part in humoral immune response.
C- carry antigens of pathogen on their surfaces D- both (A and C) are correct

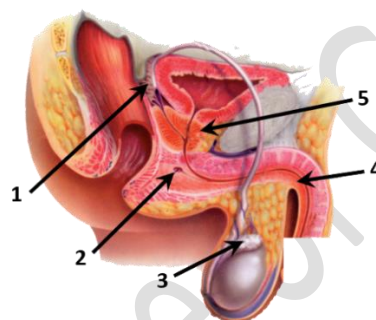

6-When the, in the blood the sensors in the brain send a message to the respiratory muscles to return to a slower breathing rate.

- A- carbon dioxide concentration decreases B- carbon dioxide concentration increases
C- the oxygen and carbon dioxide concentration increase D- the oxygen concentration decreases

7-Which structures of the adjacent figure are **NOT** within the path taken

by the sperm as they leave the body?

- A- 2, 3, 5
B- 2, 3, 4
C- 1, 2, 5
D- 1, 2, 4

8-In the process of hearing which of the following releases neurotransmitters?

- A- the hair cells B- the fluid inside the cochlea
C- the membrane that covers the hair cells D- the bottom membrane of the middle chamber

9-The similarity between the mechanism of action of amino acid-based hormones and the mechanism of action of thyroid hormones is that both mechanisms need to: -

- A- target cell B- second messenger C- bind to its own receptor D- both (A and C) are correct

10-Which of the following is correct regarding the Langerhans Islands?

- A- secrete two amino acid-based hormones that lower the blood sugar level
B- contain mostly exocrine cells C- function as an endocrine gland. D- all of them are correct

11-Opportunistic infections: -

- A- can be considered as evidence that the HIV infection has progressed to AIDS
B- the organisms of these diseases usually do not create problems in people with a healthy immune system
C- appear in phase I of HIV infection D- both (A and B) are correct

12-During inspiration, the diaphragm....., causing the air pressure inside the lungsthan the air pressure outside the body: -

- A- flattens, lower B- contracts, higher
C- relaxes, lower D- flattens, higher

13-The cardiovascular system differs from the lymphatic system in that the cardiovascular system:

- A- is a part of the circulatory system B- contains red blood cells
C- its vessels are one-way that transport the fluid it contains from the tissues to the heart
D- contains lymphocytes

14-Which of the following is correct about red blood cells?

- A- immature red blood cells synthesize large amounts of hemoglobin
B- their cell nucleus and organelles disintegrate C- they form antibodies D- both (A and B) are correct

15-In phase II of HIV infection, all of the following occur **EXCEPT**: -

- A- the virus continues to replicate. B- helper T cells can no longer stimulate B cells.
C- B cells continue to make a large amount of antibody against HIV
D- The number of helper T cells drops steadily

16-In this blood transfusion process $AB^+ \rightarrow O^-$:-

(1- anti-Rh antibodies will react with Rh antigens ,2- anti-A antibodies will react with A antigens, 3- anti-B antibodies will react with B antigens)

- A- 1, 2 B- 1, 2, 3, C- 1, 3 D- 2, 3

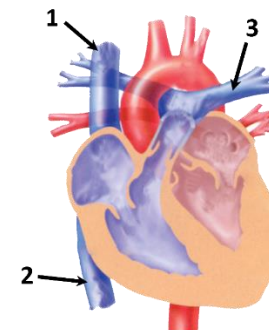

17-Which of the following directs most incoming sensory signals to the proper region of the cerebral cortex:

- A- midbrain B- medulla oblongata C- pons D- thalamus

18-Depending on the adjacent figure, all blood vessels

that are labeled by numbers 1, 2, 3: -

- A- are veins
B- carry deoxygenated blood to the heart
C- their walls are made up of three layers
D- both (A and C) are correct

19-In skeletal muscle the tissue that bounds together a group of fascicles is a(an): -

- A- epithelial tissues B- nervous tissue C- muscle tissue D- connective tissue

20-Which of the following is a function of the long bone:

- A- its ability to contract and relax enables the body to move B- produces platelets
C- helps the body to maintain a constant temperature D- all of them are correct

21-The male reproductive system structure that lies between the bladder and the rectum, produces a fluid: -

- A- rich in sugars B- that neutralizes the acids in the female reproductive system
C- that neutralizes traces of acidic urine in the urethra D- all of them are incorrect

22-Tobacco: -

- A- contains no substance that causes addiction B- causes chronic bronchitis
C- burning of it produces tars that paralyzes the cilia that line the respiratory tracts D- both (B and C) are correct

23-The smooth muscle differs from the skeletal muscle in that the smooth muscle: -

- A- has origin and insertion points B- is striated C- forms the walls of the internal organs D- is voluntary

24-In the axial skeleton, the red bone marrow is found in the:-

- A- scapula B- clavicle C- sternum D- both (B and C) are correct

25-In the primary and secondary immune responses: -

- A- memory cells are produced B- antibodies are produced
C- antigens are attacked D- all of them are correct

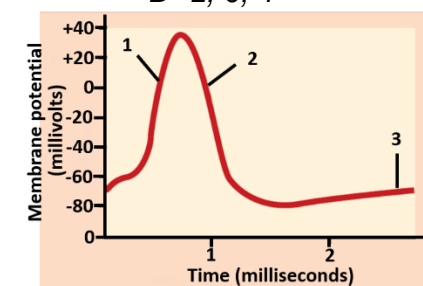

26-Which of the following are the characteristics of the atrioventricular node?

(1- It is located in the septum between the two ventricles, 2- it relays the electrical impulse to the muscle cells that make up the ventricles, 3- it regulates the rate of contraction of the entire heart, 4- it initiates an electrical impulse and causes a QRS wave in the electrocardiograph(ECG))

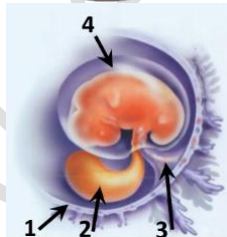

- A- 1, 3, 4 B- 2, 4 C- 1, 2, 4 D- 2, 3, 4

27- Which point on the graph represents when the voltage-gated sodium channels are open?

- A- only 1
B- 1 and 3
C- only 3
D- 2 and 3

- 28-** Which of the following is **incorrect** for a relaxed muscle?
A- the length of the actin and the myosin filaments does not change in comparison to a contracted muscle
B- the actin and myosin filaments overlap **C-** the actin and myosin filaments slide past each other
D- all of them are incorrect.
- 29-** Uterus contains target cells for which of the following hormones?
A- estrogen **B-** progesterone **C-** oxytocin **D-** all of them are correct
- 30-** Which of the following often results in addiction?
A- tolerance **B-** withdrawal **C-** dependence **D-** effective dose
- 31-** Which of the following pairs are correctly matched? **A-** macrophages : display antigens on its surface
B- complement system proteins : are released by cells infected with virus
C- stomach acids : are specific defenses **D-** thymus : helps produce all kinds of lymphocytes.
- 32-** Which of the following does **NOT** occur during the first trimester of pregnancy?
A- the legs, eyes, and ears have begun to develop **B-** the fetus can react to loud sounds.
C- fingers are formed. **D-** the heart begins to beat.
- 33-** All of the following are correct about chemical receptors, **EXCEPT**:
A- are neurons that detect stimuli **B-** are clustered in taste buds
C- are found in the mucous lining of the epithelium in the nasal passages
D- the action potentials they produce are interpreted only in the parietal lobe of the cerebral cortex
- 34-** Which of the following is correct regarding the Schwann cell?
A- transmits nerve impulses from the cell body towards the nerve endings
B- produces the myelin around the axon of neurons that are not found in the brain or in the spinal cord
C- receives stimuli from other neurons and transmits them towards the nerve endings
D- produces the myelin around the axon of all neurons
- 35-** What is the role of the follicle-stimulating hormone in humans?
A- along with testosterone, stimulates sperm production **B-** stimulates the secretion of testosterone
C- stimulates cell division in a follicle **D-** both (A and C) are correct
- 36-** The adjacent figure shows which of the following?
A- a Haversian canal that is surrounded by lamellae in compact bone.
B- a spongy bone that has a latticework structure.
C- a periosteum that contains a network of blood vessels.
D- a long bone cavity that contains the yellow bone marrow.
- 37-** In the adjacent figure, which number points to the membrane that surrounds all of the other embryonic membranes ?
A- 1 **B-** 2 **C-** 3 **D-** 4
- 38-** Plasma cells: - **A-** secrete antibodies **B-** create holes in the membranes of the infected cells
C- make antibodies **D-** both (A and C) are correct
- 39-** Which of the following is correct regarding the cerebellum?
A- it lies below and before the cerebral hemispheres **B-** the surface of cerebellum is highly folded
C- It receives motor impulses coming from the ears **D-** all of them are correct
- 40-** In which of the following states of the monohybrid crosses ,50% of the resulting individuals are recessive?
A- If both parents are homozygous and dominant
B- If one of the parents is recessive and the other is heterozygous
C- If one of the parents is homozygous and dominant and the other is heterozygous
D- If both parents are heterozygous
- 41-** In the process of DNA replication: -
A- the number of purines in one of the new strands is equal to the number of pyrimidines in the other new strand
B- the number of pyrimidines in one of the new strands is equal to the number of pyrimidines in the other new strand
C- each original strand serves as a template to make an identical strand as itself **D-** both (A and C) are correct

- 42-** In which of the following crosses the ratio of genotype and the ratio of phenotype of the resulting individuals are equal?
A- the cross between two heterozygous individuals in incomplete dominance
B- monohybrid cross between two heterozygous individuals in complete dominance
C- dihybrid cross between two homozygous individuals for both characteristics in complete dominance
D- both (A and C) are correct
- 43-** In each replication fork there are:-
A- two helicases and one DNA polymerase **B-** one helicase and two DNA polymerases
C- one helicase and one DNA polymerase **D-** two helicases and two DNA polymerases
- 44-** Which of the following is **INCORRECT**?
A- the codon AUG specifies the amino acid methionine in genetic code.
B- the number of anti-codons is 61 anti-codons.
C- the number of codons that specify amino acids is 61 codons
D- the codon GCU, which specifies the amino acid alanine in genetic code, can specify another different amino acid
- 45-** Which of the following represents the sequence that was used to transcribed this sequence (CUC AAG UGC UUC) of mRNA?
A- CUCAAGUGCUUC **B-** GAGUUCACGAAG **C-** GAGTTCACGAAG **D-** AGACCTGTAGGA
- 46-** Avery and his colleagues' experiments found that the cells.....unable to convert R cells into S cells.
A- missing DNA **B-** containing DNA **C-** missing protein **D-** missing RNA
- 47-** If the probability that a specific trait will appear in a generation is ($\frac{3}{16}$) and the number of individuals for this trait is (300) individuals, what is the total number of individuals in this generation?
A- 300 individuals **B-** 800 individuals **C-** 1600 individuals **D-** 2400 individuals
- 48-** In complete dominance the trait of smooth seeds appears when its genotype is.....,but the trait of the terminal flower appears when its genotype is.....
A- only homozygous, only heterozygous **B-** only heterozygous, only homozygous
C- homozygous or heterozygous, only homozygous **D-** only heterozygous, homozygous or heterozygous
- 49-** Based on the adjacent table, that shows the ratio of nitrogen bases in humans, virus X, and wheat, which of the following choices is correct:
A- DNA in X virus is single-stranded DNA
B- DNA in human, X virus, and wheat are in the form of a double helix. .
C- the ratio of purines to pyrimidines in human, X virus and wheat is 1:1.
D- all of them are correct
- 50-** Considering the three components of a nucleotide, how many nucleotides are identical (which have the exact same structure) in both DNA and RNA?
A- zero **B-** 2 **C-** 3 **D-** 4

	Adenine(A)	Thymine(T)	Guanine(G)	Cytosine(C)
Human	30.4	30.1	19.6	19.9
X virus	34.2	25.8	13.8	26.2
Wheat	27.3	27.1	22.7	22.8

Note: choose the correct answer:

(2 marks for each right answer)

1-Uterus contains target cells for which of the following hormones?

- A- estrogen B- progesterone C- oxytocin D- all of them are correct

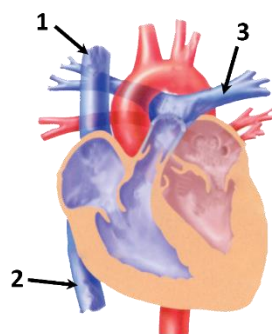

2-Which of the following pairs are correctly matched?

- A- macrophages : display antigens on its surface
B- complement system proteins : are released by cells infected with virus
C- stomach acids : are specific defenses D- thymus : helps produce all kinds of lymphocytes.

3-Depending on the adjacent figure, all blood vessels

that are labeled by numbers 1, 2, 3: -

- A- are veins
B- carry deoxygenated blood to the heart
C- their walls are made up of three layers
D- both (A and C) are correct

4-One of the following is secreted by a ductal gland:-

- A- aldosterone B- human chorionic gonadotropin C- cortisol D- lysozyme

5-Plasma cells: -

- A- secrete antibodies B- create holes in the membranes of the infected cells
C- make antibodies D- both (A and C) are correct

6-In the axial skeleton, the red bone marrow is found in the:-

- A- scapula B- clavicle C- sternum D- both (B and C) are correct

7-Which of the following are the characteristics of the atrioventricular node?

- (1- It is located in the septum between the two ventricles, 2- it relays the electrical impulse to the muscle cells that make up the ventricles, 3- it regulates the rate of contraction of the entire heart, 4- it initiates an electrical impulse and causes a QRS wave in the electrocardiograph(ECG))

- A- 1, 3, 4 B- 2, 4 C- 1, 2, 4 D- 2, 3, 4

8-Which of the following is **incorrect** for a relaxed muscle?

- A- the length of the actin and the myosin filaments does not change in comparison to a contracted muscle
B- the actin and myosin filaments overlap C- the actin and myosin filaments slide past each other
D- all of them are incorrect.

9-Opportunistic infections: -

- A- can be considered as evidence that the HIV infection has progressed to AIDS
B- the organisms of these diseases usually do not create problems in people with a healthy immune system
C- appear in phase I of HIV infection D- both (A and B) are correct

10-Tobacco: -

- A- contains no substance that causes addiction B- causes chronic bronchitis
C- burning of it produces tars that paralyzes the cilia that line the respiratory tracts D- both (B and C) are correct

11-How many different genotypes can result from a dihybrid cross between two pea plants? If you know that one plant is a heterozygous of both traits and the other is unknown genotype, and that the ratio of heterozygous individuals for the two traits resulting from this cross is 25%.

- A- 2 B- 4 C- 8 D- all of them are incorrect

12-Which of the following is correct regarding the Schwann cell?

- A- transmits nerve impulses from the cell body towards the nerve endings
B- produces the myelin around the axon of neurons that are not found in the brain or in the spinal cord
C- receives stimuli from other neurons and transmits them towards the nerve endings
D- produces the myelin around the axon of all neurons

13-The cardiovascular system differs from the lymphatic system in that the cardiovascular system:

- A- is a part of the circulatory system B- contains red blood cells
C- its vessels are one-way that transport the fluid it contains from the tissues to the heart
D- contains lymphocytes

14-What is the role of the follicle-stimulating hormone in humans?

- A- along with testosterone, stimulates sperm production B- stimulates the secretion of testosterone
C- stimulates cell division in a follicle D- both (A and C) are correct

15-All of the following are correct about chemical receptors, **EXCEPT**:

- A- are neurons that detect stimuli B- are clustered in taste buds
C- are found in the mucous lining of the epithelium in the nasal passages
D- the action potentials they produce are interpreted only in the parietal lobe of the cerebral cortex

16-Which of the following is a function of the long bone:

- A- its ability to contract and relax enables the body to move B- produces platelets
C- helps the body to maintain a constant temperature D- all of them are correct

17-The similarity between the mechanism of action of amino acid-based hormones and the mechanism of action of thyroid hormones is that both mechanisms need to: -

- A- target cell B- second messenger C- bind to its own receptor D- both (A and C) are correct

18-Which of the following is correct regarding the cerebellum?

- A- it lies below and before the cerebral hemispheres B- the surface of cerebellum is highly folded
C- It receives motor impulses coming from the ears D- all of them are correct

19-Which of the following is correct about red blood cells?

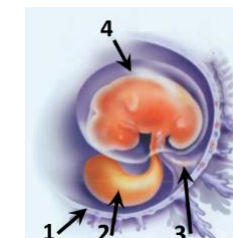

- A- immature red blood cells synthesize large amounts of hemoglobin
B- their cell nucleus and organelles disintegrate C- they form antibodies D- both (A and B) are correct

20-In phase II of HIV infection, all of the following occur **EXCEPT**: -

- A- the virus continues to replicate. B- helper T cells can no longer stimulate B cells.
C- B cells continue to make a large amount of antibody against HIV
D- The number of helper T cells drops steadily

21- In the adjacent figure, which number points to the membrane that surrounds all of the other embryonic membranes ?

- A- 1
B- 2
C- 3
D- 4

22-Which of the following does **NOT** occur during the first trimester of pregnancy?

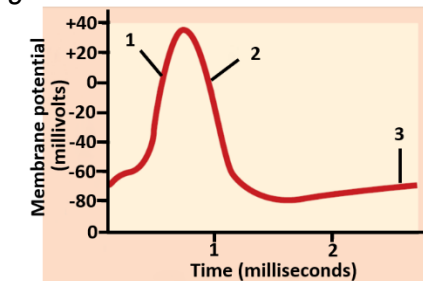

- A- the legs, eyes, and ears have begun to develop B- the fetus can react to loud sounds.
C- fingers are formed. D- the heart begins to beat.

23-Which of the following is correct regarding the Langerhans Islands?

- A- secrete two amino acid-based hormones that lower the blood sugar level
B- contain mostly exocrine cells C- function as an endocrine gland. D- all of them are correct

24- Which point on the graph represents when the voltage-gated sodium channels are open?

- A- only 1
B- 1 and 3
C- only 3
D- 2 and 3

25-During inspiration, the diaphragm....., causing the air pressure inside the lungsthan the air pressure outside the body: -

- A- flattens, lower B- contracts, higher
C- relaxes, lower D- flattens, higher

26-Which of the following is **incorrect**?

- (1- Only artery carries oxygenated blood, 2- The artery and the vein both have an inner layer of endothelial tissue, 3- The artery divides into smaller blood vessels until they end in capillaries, 4- Only vein carries deoxygenated blood).

- A- 1, 3, 4 B- 1, 4 C- 1, 2, 4 D- 2, 3, 4

27-The male reproductive system structure that lies between the bladder and the rectum, produces a fluid: -

- A-** rich in sugars **B-** that neutralizes the acids in the female reproductive system
C- that neutralizes traces of acidic urine in the urethra **D-** all of them are incorrect

28-In skeletal muscle the tissue that bounds together a group of fascicles is a(an): -

- A-** epithelial tissues **B-** nervous tissue **C-** muscle tissue **D-** connective tissue

29- The adjacent figure shows which of the following?

- A-** a Haversian canal that is surrounded by lamellae in compact bone.
B- a spongy bone that has a latticework structure.
C- a periosteum that contains a network of blood vessels.
D- a long bone cavity that contains the yellow bone marrow.

30-Which of the following directs most incoming sensory signals to the proper region of the cerebral cortex:

- A-** midbrain **B-** medulla oblongata **C-** pons **D-** thalamus

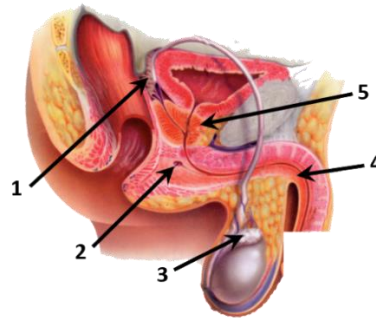

31-In the primary and secondary immune responses: -

- A-** memory cells are produced **B-** antibodies are produced
C- antigens are attacked **D-** all of them are correct

32-Which structures of the adjacent figure are **NOT** within the path taken

by the sperm as they leave the body?

- A-** 2, 3, 5
B- 2, 3, 4
C- 1, 2, 5
D- 1, 2, 4

33-Both natural killer cells and inhibitory T cells

- A-** are white blood cells. **B-** play a part in humoral immune response.
C- carry antigens of pathogen on their surfaces **D-** both (A and C) are correct

34-In the process of hearing which of the following releases neurotransmitters?

- A-** the hair cells **B-** the fluid inside the cochlea
C- the membrane that covers the hair cells **D-** the bottom membrane of the middle chamber

35-In this blood transfusion process $AB^+ \rightarrow O^-$:-

(1- anti-Rh antibodies will react with Rh antigens ,2- anti-A antibodies will react with A antigens, 3- anti-B antibodies will react with B antigens)

- A-** 1 , 2 **B-** 1 , 2 , 3, **C-** 1 , 3 **D-** 2 , 3

36-Epiphyseal plate is **NOT** found at the ends of immature: -.

- A-** fibula bone **B-** skull bones **C-** humerus bone **D-** tibia bone

37-The smooth muscle differs from the skeletal muscle in that the smooth muscle: -

- A-** has origin and insertion points **B-** is striated **C-** forms the walls of the internal organs **D-** is voluntary

38-When the, in the blood the sensors in the brain send a message to the respiratory muscles to return to a slower breathing rate.

- A-** carbon dioxide concentration decreases **B-** carbon dioxide concentration increases
C- the oxygen and carbon dioxide concentration increase **D-** the oxygen concentration decreases

39-Which of the following often results in addiction?

- A-** tolerance **B-** withdrawal **C-** dependence **D-** effective dose

40-In which of the following states of the monohybrid crosses ,50% of the resulting individuals are recessive?

- A-** If both parents are homozygous and dominant
B- If one of the parents is recessive and the other is heterozygous
C- If one of the parents is homozygous and dominant and the other is heterozygous
D- If both parents are heterozygous

41-Avery and his colleagues' experiments found that the cells.....unable to convert R cells into S cells.

- A-** missing DNA **B-** containing DNA **C-** missing protein **D-** missing RNA

42-In each replication fork there are:-

- A-** two helicases and one DNA polymerase **B-** one helicase and two DNA polymerases
C- one helicase and one DNA polymerase **D-** two helicases and two DNA polymerases

43-Which of the following represents the sequence that was used to transcribed this sequence (CUC AAG UGC UUC) of mRNA?

- A-** CUCAAGUGCUUC **B-** GAGUUCACGAAG **C-** GAGTTCACGAAG **D-** AGACCTGTAGGA

44-In which of the following crosses the ratio of genotype and the ratio of phenotype of the resulting individuals are equal?

- A-** the cross between two heterozygous individuals in incomplete dominance
B- monohybrid cross between two heterozygous individuals in complete dominance
C- dihybrid cross between two homozygous individuals for both characteristics in complete dominance
D- both (A and C) are correct

45-Based on the adjacent table, that shows the ratio of nitrogen bases in humans, virus X, and wheat, which of the following choices is correct:

	Adenine(A)	Thymine(T)	Guanine(G)	Cytosine(C)
Human	30.4	30.1	19.6	19.9
X virus	34.2	25.8	13.8	26.2
Wheat	27.3	27.1	22.7	22.8

A- DNA in X virus is single-stranded DNA

B- DNA in human, X virus, and wheat are in the form of a double helix. .

C- the ratio of purines to pyrimidines in human, X virus and wheat is 1:1.

D- all of them are correct

46-In complete dominance the trait of smooth seeds appears when its genotype is.....,but the trait of the terminal flower appears when its genotype is.....

- A-** only homozygous, only heterozygous **B-** only heterozygous, only homozygous
C- homozygous or heterozygous, only homozygous **D-** only heterozygous, homozygous or heterozygous

47-Considering the three components of a nucleotide, how many nucleotides are identical (which have the exact same structure) in both DNA and RNA?

- A-** zero **B-** 2 **C-** 3 **D-** 4

48- In the process of DNA replication: -

- A-**the number of purines in one of the new strands is equal to the number of pyrimidines in the other new strand
B-the number of pyrimidines in one of the new strands is equal to the number of pyrimidines in the other new strand
C-each original strand serves as a template to make an identical strand as itself **D-** both (A and C) are correct

49-If the probability that a specific trait will appear in a generation is ($\frac{3}{16}$) and the number of individuals for this trait is (300) individuals, what is the total number of individuals in this generation?

- A-** 300 individuals **B-** 800 individuals **C-** 1600 individuals **D-** 2400 individuals

50-Which of the following is **INCORRECT**?

- A-** the codon AUG specifies the amino acid methionine in genetic code.
B- the number of anti-codons is 61 anti-codons.
C- the number of codons that specify amino acids is 61 codons
D- the codon GCU, which specifies the amino acid alanine in genetic code, can specify another different amino acid

Note: choose the correct answer:

(2 marks for each right answer)

1-In skeletal muscle the tissue that bounds together a group of fascicles is a(an): -

- A- epithelial tissues B- nervous tissue C- muscle tissue D- connective tissue

2-When the, in the blood the sensors in the brain send a message to the respiratory muscles to return to a slower breathing rate.

- A- carbon dioxide concentration decreases B- carbon dioxide concentration increases
C- the oxygen and carbon dioxide concentration increase D- the oxygen concentration decreases

3-Which of the following is **incorrect**?

(1- Only artery carries oxygenated blood, 2- The artery and the vein both have an inner layer of endothelial tissue, 3- The artery divides into smaller blood vessels until they end in capillaries, 4- Only vein carries deoxygenated blood).

- A- 1, 3, 4 B- 1, 4 C- 1, 2, 4 D- 2, 3, 4

4-Which of the following are the characteristics of the atrioventricular node?

(1- It is located in the septum between the two ventricles, 2- it relays the electrical impulse to the muscle cells that make up the ventricles, 3- it regulates the rate of contraction of the entire heart, 4- it initiates an electrical impulse and causes a QRS wave in the electrocardiograph(ECG))

- A- 1, 3, 4 B- 2, 4 C- 1, 2, 4 D- 2, 3, 4

5-Plasma cells: -

- A- secrete antibodies B- create holes in the membranes of the infected cells
C- make antibodies D- both (A and C) are correct

6-In the process of hearing which of the following releases neurotransmitters?

- A- the hair cells B- the fluid inside the cochlea
C- the membrane that covers the hair cells D- the bottom membrane of the middle chamber

7-What is the role of the follicle-stimulating hormone in humans?

- A- along with testosterone, stimulates sperm production B- stimulates the secretion of testosterone
C- stimulates cell division in a follicle D- both (A and C) are correct

8-Uterus contains target cells for which of the following hormones?

- A- estrogen B- progesterone C- oxytocin D- all of them are correct

9-The similarity between the mechanism of action of amino acid-based hormones and the mechanism of action of thyroid hormones is that both mechanisms need to: -

- A- target cell B- second messenger C- bind to its own receptor D- both (A and C) are correct

10-All of the following are correct about chemical receptors, **EXCEPT**:

- A- are neurons that detect stimuli B- are clustered in taste buds
C- are found in the mucous lining of the epithelium in the nasal passages
D- the action potentials they produce are interpreted only in the parietal lobe of the cerebral cortex

11-Both natural killer cells and inhibitory T cells

- A- are white blood cells. B- play a part in humoral immune response.
C- carry antigens of pathogen on their surfaces D- both (A and C) are correct

12-Which of the following is correct regarding the cerebellum?

- A- it lies below and before the cerebral hemispheres B- the surface of cerebellum is highly folded
C- It receives motor impulses coming from the ears D- all of them are correct

13-Epiphyseal plate is **NOT** found at the ends of immature: -.

- A- fibula bone B- skull bones C- humerus bone D- tibia bone

14-Which of the following pairs are correctly matched? A- macrophages : display antigens on its surface

- B- complement system proteins : are released by cells infected with virus
C- stomach acids : are specific defenses D- thymus : helps produce all kinds of lymphocytes.

15-In the primary and secondary immune responses: -

- A- memory cells are produced B- antibodies are produced
C- antigens are attacked D- all of them are correct

16-In phase II of HIV infection, all of the following occur **EXCEPT**: -

- A- the virus continues to replicate. B- helper T cells can no longer stimulate B cells.
C- B cells continue to make a large amount of antibody against HIV
D- The number of helper T cells drops steadily

17-Which of the following is a function of the long bone:

- A- its ability to contract and relax enables the body to move B- produces platelets
C- helps the body to maintain a constant temperature D- all of them are correct

18- The adjacent figure shows which of the following?

- A- a Haversian canal that is surrounded by lamellae in compact bone.
B- a spongy bone that has a latticework structure.
C- a periosteum that contains a network of blood vessels.
D- a long bone cavity that contains the yellow bone marrow.

19-Which of the following often results in addiction?

- A- tolerance B- withdrawal C- dependence D- effective dose

20-Which of the following is **incorrect** for a relaxed muscle?

- A- the length of the actin and the myosin filaments does not change in comparison to a contracted muscle
B- the actin and myosin filaments overlap C- the actin and myosin filaments slide past each other
D- all of them are incorrect.

21-Opportunistic infections: -

- A- can be considered as evidence that the HIV infection has progressed to AIDS
B- the organisms of these diseases usually do not create problems in people with a healthy immune system
C- appear in phase I of HIV infection D- both (A and B) are correct

22-Which of the following is correct about red blood cells?

- A- immature red blood cells synthesize large amounts of hemoglobin
B- their cell nucleus and organelles disintegrate C- they form antibodies D- both (A and B) are correct

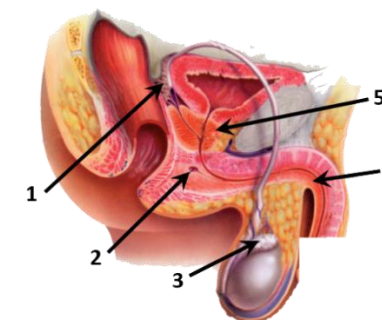

23-During inspiration, the diaphragm....., causing the air pressure inside the lungsthan the air pressure outside the body: -

- A- flattens, lower B- contracts, higher
C- relaxes, lower D- flattens, higher

24-Which structures of the adjacent figure are **NOT** within the path taken

by the sperm as they leave the body?

- A- 2, 3, 5
B- 2, 3, 4
C- 1, 2, 5
D- 1, 2, 4

25-One of the following is secreted by a ductal gland:-

- A- aldosterone B- human chorionic gonadotropin C- cortisol D- lysozyme

26-The male reproductive system structure that lies between the bladder and the rectum, produces a fluid: -

- A- rich in sugars B- that neutralizes the acids in the female reproductive system
C- that neutralizes traces of acidic urine in the urethra D- all of them are incorrect

27-In this blood transfusion process $AB^+ \longrightarrow O^-$:-

(1- anti-Rh antibodies will react with Rh antigens ,2- anti-A antibodies will react with A antigens, 3- anti-B antibodies will react with B antigens)

- A- 1, 2 B- 1, 2, 3, C- 1, 3 D- 2, 3

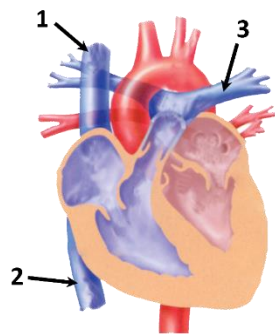

28-Which of the following is correct regarding the Langerhans Islands?

- A- secrete two amino acid-based hormones that lower the blood sugar level
B- contain mostly exocrine cells C- function as an endocrine gland. D- all of them are correct

29-The smooth muscle differs from the skeletal muscle in that the smooth muscle: -

- A- has origin and insertion points B- is striated C- forms the walls of the internal organs D- is voluntary

30-Depending on the adjacent figure, all blood vessels that are labeled by numbers 1, 2, 3: -

- A- are veins
- B- carry deoxygenated blood to the heart
- C- their walls are made up of three layers
- D- both (A and C) are correct

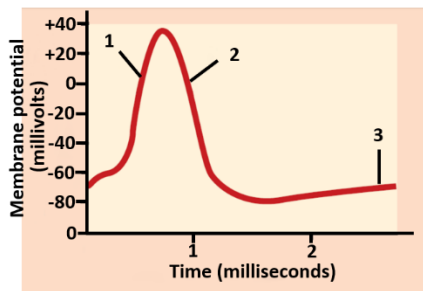

31-Tobacco: -
A- contains no substance that causes addiction
B- causes chronic bronchitis
C- burning of it produces tars that paralyzes the cilia that line the respiratory tracts
D- both (B and C) are correct

32-How many different genotypes can result from a dihybrid cross between two pea plants? If you know that one plant is a heterozygous of both traits and the other is unknown genotype, and that the ratio of heterozygous individuals for the two traits resulting from this cross is 25%.
A- 2 B- 4 C- 8 D- all of them are incorrect

33-Which of the following does **NOT** occur during the first trimester of pregnancy?
A- the legs, eyes, and ears have begun to develop
B- the fetus can react to loud sounds.
C- fingers are formed.
D- the heart begins to beat.

34-The cardiovascular system differs from the lymphatic system in that the cardiovascular system:
A- is a part of the circulatory system
B- contains red blood cells
C- its vessels are one-way that transport the fluid it contains from the tissues to the heart
D- contains lymphocytes

35- Which point on the graph represents when the voltage-gated sodium channels are open?
A- only 1
B- 1 and 3
C- only 3
D- 2 and 3

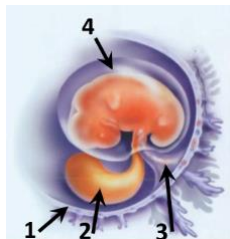

36-In the axial skeleton, the red bone marrow is found in the:-
A- scapula B- clavicle C- sternum D- both (B and C) are correct

37-Which of the following directs most incoming sensory signals to the proper region of the cerebral cortex:
A- midbrain B- medulla oblongata C- pons D- thalamus

38-Which of the following is correct regarding the Schwann cell?
A- transmits nerve impulses from the cell body towards the nerve endings
B- produces the myelin around the axon of neurons that are not found in the brain or in the spinal cord
C- receives stimuli from other neurons and transmits them towards the nerve endings
D- produces the myelin around the axon of all neurons

39- In the adjacent figure, which number points to the membrane that surrounds all of the other embryonic membranes ?
A- 1
B- 2
C- 3
D- 4

40-In which of the following states of the monohybrid crosses ,50% of the resulting individuals are recessive?
A- If both parents are homozygous and dominant
B- If one of the parents is recessive and the other is heterozygous
C- If one of the parents is homozygous and dominant and the other is heterozygous
D- If both parents are heterozygous

41-If the probability that a specific trait will appear in a generation is ($\frac{3}{16}$) and the number of individuals for this trait is (300) individuals, what is the total number of individuals in this generation?

- A- 300 individuals B- 800 individuals C- 1600 individuals D- 2400 individuals
- 42-Considering the three components of a nucleotide, how many nucleotides are identical (which have the exact same structure) in both DNA and RNA?
A- zero B- 2 C- 3 D- 4

43-In each replication fork there are:-
A- two helicases and one DNA polymerase B- one helicase and two DNA polymerases
C- one helicase and one DNA polymerase D- two helicases and two DNA polymerases

44-Which of the following represents the sequence that was used to transcribed this sequence (CUC AAG UGC UUC) of mRNA?
A- CUCAAGUGCUUC B- GAGUUCACGAAG C- GAGTTCACGAAG D- AGACCTGTAGGA

45-In complete dominance the trait of smooth seeds appears when its genotype is.....,but the trait of the terminal flower appears when its genotype is.....
A- only homozygous, only heterozygous B- only heterozygous, only homozygous
C- homozygous or heterozygous, only homozygous D- only heterozygous, homozygous or heterozygous

46-Based on the adjacent table, that shows the ratio of nitrogen bases in humans, virus X, and wheat, which of the following choices is correct:
A- DNA in X virus is single-stranded DNA
B- DNA in human, X virus, and wheat are in the form of a double helix. .
C- the ratio of purines to pyrimidines in human, X virus and wheat is 1:1.
D- all of them are correct

	Adenine(A)	Thymine(T)	Guanine(G)	Cytosine(C)
Human	30.4	30.1	19.6	19.9
X virus	34.2	25.8	13.8	26.2
Wheat	27.3	27.1	22.7	22.8

47-Avery and his colleagues' experiments found that the cells.....unable to convert R cells into S cells.
A- missing DNA B- containing DNA C- missing protein D- missing RNA

48- In the process of DNA replication: -
A-the number of purines in one of the new strands is equal to the number of pyrimidines in the other new strand
B-the number of pyrimidines in one of the new strands is equal to the number of pyrimidines in the other new strand
C-each original strand serves as a template to make an identical strand as itself D- both (A and C) are correct

49-In which of the following crosses the ratio of genotype and the ratio of phenotype of the resulting individuals are equal?
A- the cross between two heterozygous individuals in incomplete dominance
B- monohybrid cross between two heterozygous individuals in complete dominance
C- dihybrid cross between two homozygous individuals for both characteristics in complete dominance
D- both (A and C) are correct

50-Which of the following is **INCORRECT**?
A- the codon AUG specifies the amino acid methionine in genetic code.
B- the number of anti-codons is 61 anti-codons.
C- the number of codons that specify amino acids is 61 codons
D- the codon GCU, which specifies the amino acid alanine in genetic code, can specify another different amino acid

Note: choose the correct answer:

(2 marks for each right answer)

1-What is the role of the follicle-stimulating hormone in humans?

- A- along with testosterone, stimulates sperm production
B- stimulates the secretion of testosterone
C- stimulates cell division in a follicle
D- both (A and C) are correct

2-In the primary and secondary immune responses: -

- A- memory cells are produced
B- antibodies are produced
C- antigens are attacked
D- all of them are correct

3-Which of the following does **NOT** occur during the first trimester of pregnancy?

- A- the legs, eyes, and ears have begun to develop
B- the fetus can react to loud sounds.
C- fingers are formed.
D- the heart begins to beat.

4-Opportunistic infections: -

- A- can be considered as evidence that the HIV infection has progressed to AIDS
B- the organisms of these diseases usually do not create problems in people with a healthy immune system
C- appear in phase I of HIV infection
D- both (A and B) are correct

5-Which of the following are the characteristics of the atrioventricular node?

- (1- It is located in the septum between the two ventricles, 2- it relays the electrical impulse to the muscle cells that make up the ventricles, 3- it regulates the rate of contraction of the entire heart, 4- it initiates an electrical impulse and causes a QRS wave in the electrocardiograph(ECG))

- A- 1, 3, 4
B- 2, 4
C- 1, 2, 4
D- 2, 3, 4

6-Which of the following is **incorrect**?

- (1- Only artery carries oxygenated blood, 2- The artery and the vein both have an inner layer of endothelial tissue, 3- The artery divides into smaller blood vessels until they end in capillaries, 4- Only vein carries deoxygenated blood).

- A- 1, 3, 4
B- 1, 4
C- 1, 2, 4
D- 2, 3, 4

7-In phase II of HIV infection, all of the following occur **EXCEPT**: -

- A- the virus continues to replicate.
B- helper T cells can no longer stimulate B cells.
C- B cells continue to make a large amount of antibody against HIV
D- The number of helper T cells drops steadily

8-Epiphyseal plate is **NOT** found at the ends of immature: -

- A- fibula bone
B- skull bones
C- humerus bone
D- tibia bone

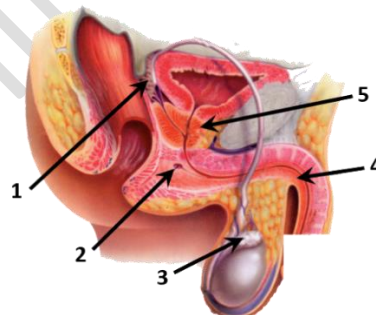

9-Which of the following is correct about red blood cells?

- A- immature red blood cells synthesize large amounts of hemoglobin
B- their cell nucleus and organelles disintegrate
C- they form antibodies
D- both (A and B) are correct

10-Which structures of the adjacent figure are **NOT** within the path taken

by the sperm as they leave the body?

- A- 2, 3, 5
B- 2, 3, 4
C- 1, 2, 5
D- 1, 2, 4

11-In the axial skeleton, the red bone marrow is found in the:-

- A- scapula
B- clavicle
C- sternum
D- both (B and C) are correct

12-Which of the following often results in addiction?

- A- tolerance
B- withdrawal
C- dependence
D- effective dose

13-Both natural killer cells and inhibitory T cells

- A- are white blood cells.
B- play a part in humoral immune response.
C- carry antigens of pathogen on their surfaces
D- both (A and C) are correct

14-Which of the following is correct regarding the Langerhans Islands?

- A- secrete two amino acid-based hormones that lower the blood sugar level
B- contain mostly exocrine cells
C- function as an endocrine gland.
D- all of them are correct

15-During inspiration, the diaphragm....., causing the air pressure inside the lungsthan the air pressure outside the body: -

- A- flattens, lower
B- contracts, higher
C- relaxes, lower
D- flattens, higher

16-When the, in the blood the sensors in the brain send a message to the respiratory muscles to return to a slower breathing rate.

- A- carbon dioxide concentration decreases
B- carbon dioxide concentration increases
C- the oxygen and carbon dioxide concentration increase
D- the oxygen concentration decreases

17-Which of the following directs most incoming sensory signals to the proper region of the cerebral cortex:

- A- midbrain
B- medulla oblongata
C- pons
D- thalamus

18-The male reproductive system structure that lies between the bladder and the rectum, produces a fluid: -

- A- rich in sugars
B- that neutralizes the acids in the female reproductive system
C- that neutralizes traces of acidic urine in the urethra
D- all of them are incorrect

19-In this blood transfusion process $AB^+ \longrightarrow O^-$:-

- (1- anti-Rh antibodies will react with Rh antigens ,2- anti-A antibodies will react with A antigens, 3- anti-B antibodies will react with B antigens)

- A- 1, 2
B- 1, 2, 3,
C- 1, 3
D- 2, 3

20-Which of the following is correct regarding the Schwan cell?

- A- transmits nerve impulses from the cell body towards the nerve endings
B- produces the myelin around the axon of neurons that are not found in the brain or in the spinal cord
C- receives stimuli from other neurons and transmits them towards the nerve endings
D- produces the myelin around the axon of all neurons

21-The smooth muscle differs from the skeletal muscle in that the smooth muscle: -

- A- has origin and insertion points
B- is striated
C- forms the walls of the internal organs
D- is voluntary

22-Which of the following is correct regarding the cerebellum?

- A- it lies below and before the cerebral hemispheres
B- the surface of cerebellum is highly folded
C- It receives motor impulses coming from the ears
D- all of them are correct

23-Which of the following pairs are correctly matched? A- macrophages : display antigens on its surface

- B- complement system proteins : are released by cells infected with virus
C- stomach acids : are specific defenses
D- thymus : helps produce all kinds of lymphocytes.

24-The similarity between the mechanism of action of amino acid-based hormones and the mechanism of action of thyroid hormones is that both mechanisms need to: -

- A- target cell
B- second messenger
C- bind to its own receptor
D- both (A and C) are correct

25-How many different genotypes can result from a dihybrid cross between two pea plants? If you know that one plant is a heterozygous of both traits and the other is unknown genotype, and that the ratio of heterozygous individuals for the two traits resulting from this cross is 25%.

- A- 2
B- 4
C- 8
D- all of them are incorrect

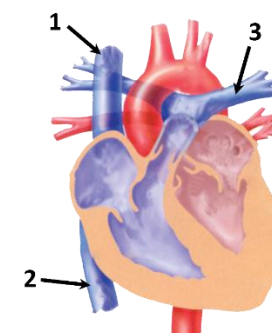

26-Tobacco: -

- A- contains no substance that causes addiction
B- causes chronic bronchitis
C- burning of it produces tars that paralyzes the cilia that line the respiratory tracts
D- both (B and C) are correct

27-Depending on the adjacent figure, all blood vessels

that are labeled by numbers 1, 2, 3: -

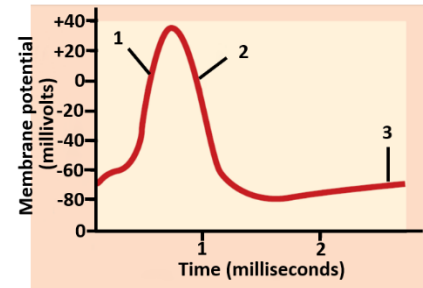

- A- are veins
B- carry deoxygenated blood to the heart
C- their walls are made up of three layers
D- both (A and C) are correct

- 28-In the process of hearing which of the following releases neurotransmitters?
A- the hair cells **B-** the fluid inside the cochlea
C- the membrane that covers the hair cells **D-** the bottom membrane of the middle chamber

- 29- Which point on the graph represents when the voltage-gated sodium channels are open?

- A-** only 1
B- 1 and 3
C- only 3
D- 2 and 3

- 30-Uterus contains target cells for which of the following hormones?

- A-** estrogen **B-** progesterone **C-** oxytocin **D-** all of them are correct

- 31-All of the following are correct about chemical receptors, **EXCEPT**:

- A-** are neurons that detect stimuli **B-** are clustered in taste buds
C- are found in the mucous lining of the epithelium in the nasal passages
D- the action potentials they produce are interpreted only in the parietal lobe of the cerebral cortex

- 32-Which of the following is **incorrect** for a relaxed muscle?

- A-** the length of the actin and the myosin filaments does not change in comparison to a contracted muscle
B- the actin and myosin filaments overlap **C-** the actin and myosin filaments slide past each other
D- all of them are incorrect.

- 33-Plasma cells: - **A-** secrete antibodies **B-** create holes in the membranes of the infected cells
C- make antibodies **D-** both (A and C) are correct

- 34-The cardiovascular system differs from the lymphatic system in that the cardiovascular system:

- A-** is a part of the circulatory system **B-** contains red blood cells
C- its vessels are one-way that transport the fluid it contains from the tissues to the heart
D- contains lymphocytes

- 35-Which of the following is a function of the long bone:

- A-** its ability to contract and relax enables the body to move **B-** produces platelets
C- helps the body to maintain a constant temperature **D-** all of them are correct

- 36-One of the following is secreted by a ductal gland:-

- A-** aldosterone **B-** human chorionic gonadotropin **C-** cortisol **D-** lysozyme

- 37-In skeletal muscle the tissue that bounds together a group of fascicles is a(an): -

- A-** epithelial tissues **B-** nervous tissue **C-** muscle tissue **D-** connective tissue

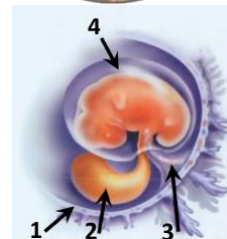

- 38- The adjacent figure shows which of the following?

- A-** a Haversian canal that is surrounded by lamellae in compact bone.
B- a spongy bone that has a latticework structure.
C- a periosteum that contains a network of blood vessels.
D- a long bone cavity that contains the yellow bone marrow.

- 39- In the adjacent figure, which number points to the membrane that surrounds all of the other embryonic membranes ?

- A-** 1
B- 2
C- 3
D- 4

- 40-In which of the following states of the monohybrid crosses ,50% of the resulting individuals are recessive?

- A-** If both parents are homozygous and dominant
B- If one of the parents is recessive and the other is heterozygous
C- If one of the parents is homozygous and dominant and the other is heterozygous
D- If both parents are heterozygous

- 41-In which of the following crosses the ratio of genotype and the ratio of phenotype of the resulting individuals are equal?

- A-** the cross between two heterozygous individuals in incomplete dominance
B- monohybrid cross between two heterozygous individuals in complete dominance
C- dihybrid cross between two homozygous individuals for both characteristics in complete dominance
D- both (A and C) are correct

- 42-Which of the following represents the sequence that was used to transcribed this sequence (CUC AAG UGC UUC) of mRNA?

- A-** CUCAAGUGCUUC **B-** GAGUUCACGAAG **C-** GAGTTCACGAAG **D-** AGACCTGTAGGA

- 43- In the process of DNA replication: -

- A-** the number of purines in one of the new strands is equal to the number of pyrimidines in the other new strand
B- the number of pyrimidines in one of the new strands is equal to the number of pyrimidines in the other new strand
C- each original strand serves as a template to make an identical strand as itself **D-** both (A and C) are correct

- 44-In each replication fork there are:-

- A-** two helicases and one DNA polymerase **B-** one helicase and two DNA polymerases
C- one helicase and one DNA polymerase **D-** two helicases and two DNA polymerases

- 45-Based on the adjacent table, that shows the ratio of nitrogen bases in humans, virus X, and wheat, which of the following choices is correct:

	Adenine(A)	Thymine(T)	Guanine(G)	Cytosine(C)
Human	30.4	30.1	19.6	19.9
X virus	34.2	25.8	13.8	26.2
Wheat	27.3	27.1	22.7	22.8

- A-** DNA in X virus is single-stranded DNA
B- DNA in human, X virus, and wheat are in the form of a double helix. .
C- the ratio of purines to pyrimidines in human, X virus and wheat is 1:1.
D- all of them are correct

- 46-Considering the three components of a nucleotide, how many nucleotides are identical (which have the exact same structure) in both DNA and RNA?

- A-** zero **B-** 2 **C-** 3 **D-** 4

- 47-In complete dominance the trait of smooth seeds appears when its genotype is.....,but the trait of the terminal flower appears when its genotype is.....

- A-** only homozygous, only heterozygous **B-** only heterozygous, only homozygous
C- homozygous or heterozygous, only homozygous **D-** only heterozygous, homozygous or heterozygous

- 48-Avery and his colleagues' experiments found that the cells.....unable to convert R cells into S cells.

- A-** missing DNA **B-** containing DNA **C-** missing protein **D-** missing RNA

- 49-If the probability that a specific trait will appear in a generation is ($\frac{3}{16}$) and the number of individuals for this trait is (300) individuals, what is the total number of individuals in this generation?

- A-** 300 individuals **B-** 800 individuals **C-** 1600 individuals **D-** 2400 individuals

- 50-Which of the following is **INCORRECT**?

- A-** the codon AUG specifies the amino acid methionine in genetic code.
B- the number of anti-codons is 61 anti-codons.
C- the number of codons that specify amino acids is 61 codons
D- the codon GCU, which specifies the amino acid alanine in genetic code, can specify another different amino acid

Note: choose the correct answer:

(2 marks for each right answer)

1-In the process of hearing which of the following releases neurotransmitters?

- A- the hair cells B- the fluid inside the cochlea
C- the membrane that covers the hair cells D- the bottom membrane of the middle chamber

2-Tobacco: -

- A- contains no substance that causes addiction B- causes chronic bronchitis
C- burning of it produces tars that paralyzes the cilia that line the respiratory tracts D- both (B and C) are correct

3-Which of the following does **NOT** occur during the first trimester of pregnancy?

- A- the legs, eyes, and ears have begun to develop B- the fetus can react to loud sounds.
C- fingers are formed. D- the heart begins to beat.

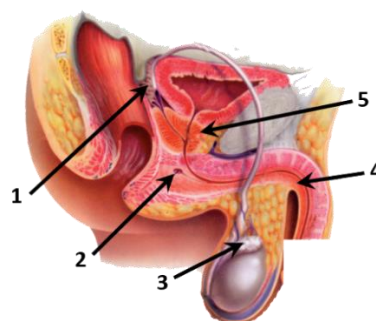

4-Epiphyseal plate is **NOT** found at the ends of immature: -

- A- fibula bone B- skull bones C- humerus bone D- tibia bone

5-Which structures of the adjacent figure are **NOT** within the path taken

by the sperm as they leave the body?

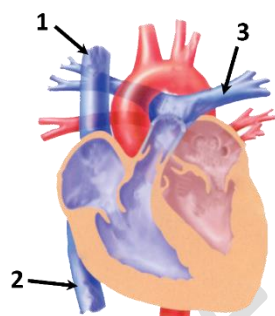

- A- 2, 3, 5
B- 2, 3, 4
C- 1, 2, 5
D- 1, 2, 4

6-Depending on the adjacent figure, all blood vessels

that are labeled by numbers 1, 2, 3: -

- A- are veins
B- carry deoxygenated blood to the heart
C- their walls are made up of three layers
D- both (A and C) are correct

7-Which of the following is a function of the long bone:

- A- its ability to contract and relax enables the body to move
C- helps the body to maintain a constant temperature

- B- produces platelets
D- all of them are correct

8-In phase II of HIV infection, all of the following occur **EXCEPT**: -

- A- the virus continues to replicate. B- helper T cells can no longer stimulate B cells.
C- B cells continue to make a large amount of antibody against HIV
D- The number of helper T cells drops steadily

9-Which of the following is correct regarding the cerebellum?

- A- it lies below and before the cerebral hemispheres B- the surface of cerebellum is highly folded
C- It receives motor impulses coming from the ears D- all of them are correct

10-How many different genotypes can result from a dihybrid cross between two pea plants? If you know that one plant is a heterozygous of both traits and the other is unknown genotype, and that the ratio of heterozygous individuals for the two traits resulting from this cross is 25%.

- A- 2 B- 4 C- 8 D- all of them are incorrect

11-Opportunistic infections: -

- A- can be considered as evidence that the HIV infection has progressed to AIDS
B- the organisms of these diseases usually do not create problems in people with a healthy immune system
C- appear in phase I of HIV infection D- both (A and B) are correct

12-One of the following is secreted by a ductal gland:-

- A- aldosterone B- human chorionic gonadotropin C- cortisol D- lysozyme

13-In the primary and secondary immune responses: -

- A- memory cells are produced B- antibodies are produced
C- antigens are attacked D- all of them are correct

14-The cardiovascular system differs from the lymphatic system in that the cardiovascular system:

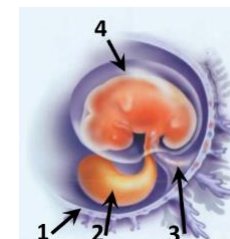

- A- is a part of the circulatory system B- contains red blood cells
C- its vessels are one-way that transport the fluid it contains from the tissues to the heart
D- contains lymphocytes

15-During inspiration, the diaphragm....., causing the air pressure inside the lungsthan the air pressure outside the body: -

- A- flattens, lower B- contracts, higher
C- relaxes, lower D- flattens, higher

16- In the adjacent figure, which number points to the membrane that surrounds all of the other embryonic membranes ?

- A- 1
B- 2
C- 3
D- 4

17-Which of the following is **incorrect** for a relaxed muscle?

- A- the length of the actin and the myosin filaments does not change in comparison to a contracted muscle
B- the actin and myosin filaments overlap C- the actin and myosin filaments slide past each other
D- all of them are incorrect.

18-The smooth muscle differs from the skeletal muscle in that the smooth muscle: -

- A- has origin and insertion points B- is striated C- forms the walls of the internal organs D- is voluntary

19-What is the role of the follicle-stimulating hormone in humans?

- A- along with testosterone, stimulates sperm production B- stimulates the secretion of testosterone
C- stimulates cell division in a follicle D- both (A and C) are correct

20-Both natural killer cells and inhibitory T cells

- A- are white blood cells. B- play a part in humoral immune response.
C- carry antigens of pathogen on their surfaces D- both (A and C) are correct

21-Which of the following is correct regarding the Schwann cell?

- A- transmits nerve impulses from the cell body towards the nerve endings
B- produces the myelin around the axon of neurons that are not found in the brain or in the spinal cord
C- receives stimuli from other neurons and transmits them towards the nerve endings
D- produces the myelin around the axon of all neurons

22-In this blood transfusion process $AB^+ \longrightarrow O^-$:-

- (1- anti-Rh antibodies will react with Rh antigens ,2- anti-A antibodies will react with A antigens, 3- anti-B antibodies will react with B antigens)

- A- 1 , 2 B- 1 , 2 , 3, C- 1 , 3 D-.2 , 3

23-In the axial skeleton, the red bone marrow is found in the:-

- A- scapula B- clavicle C- sternum D- both (B and C) are correct

24-When the, in the blood the sensors in the brain send a message to the respiratory muscles to return to a slower breathing rate.

- A- carbon dioxide concentration decreases B- carbon dioxide concentration increases
C- the oxygen and carbon dioxide concentration increase D- the oxygen concentration decreases

25- The adjacent figure shows which of the following?

- A- a Haversian canal that is surrounded by lamellae in compact bone.
B- a spongy bone that has a latticework structure.
C- a periosteum that contains a network of blood vessels.
D- a long bone cavity that contains the yellow bone marrow.

26-Uterus contains target cells for which of the following hormones?

- A- estrogen B- progesterone C- oxytocin D- all of them are correct

27-Which of the following directs most incoming sensory signals to the proper region of the cerebral cortex:

- A- midbrain B- medulla oblongata C- pons D- thalamus

28-Which of the following pairs are correctly matched? **A-** macrophages : display antigens on its surface
B- complement system proteins : are released by cells infected with virus
C- stomach acids : are specific defenses **D-** thymus : helps produce all kinds of lymphocytes.

29-Which of the following is incorrect?

(1- Only artery carries oxygenated blood, 2- The artery and the vein both have an inner layer of endothelial tissue, 3- The artery divides into smaller blood vessels until they end in capillaries, 4- Only vein carries deoxygenated blood).
A- 1, 3, 4 **B-** 1, 4 **C-** 1, 2, 4 **D-** 2, 3, 4

30-The male reproductive system structure that lies between the bladder and the rectum, produces a fluid: -

A- rich in sugars **B-** that neutralizes the acids in the female reproductive system
C- that neutralizes traces of acidic urine in the urethra **D-** all of them are incorrect

31-Which of the following are the characteristics of the atrioventricular node?

(1- It is located in the septum between the two ventricles, 2- it relays the electrical impulse to the muscle cells that make up the ventricles, 3- it regulates the rate of contraction of the entire heart, 4- it initiates an electrical impulse and causes a QRS wave in the electrocardiograph(ECG))
A- 1, 3, 4 **B-** 2, 4 **C-** 1, 2, 4 **D-** 2, 3, 4

32-Plasma cells: - **A-** secrete antibodies **B-** create holes in the membranes of the infected cells

C- make antibodies **D-** both (A and C) are correct

33-The similarity between the mechanism of action of amino acid-based hormones and the mechanism of action of thyroid hormones is that both mechanisms need to: -

A- target cell **B-** second messenger **C-** bind to its own receptor **D-** both (A and C) are correct

34-Which of the following is correct regarding the Langerhans Islands?

A- secrete two amino acid-based hormones that lower the blood sugar level
B- contain mostly exocrine cells **C-** function as an endocrine gland. **D-** all of them are correct

35-All of the following are correct about chemical receptors, EXCEPT:

A- are neurons that detect stimuli **B-** are clustered in taste buds
C- are found in the mucous lining of the epithelium in the nasal passages
D- the action potentials they produce are interpreted only in the parietal lobe of the cerebral cortex

36-Which of the following often results in addiction?

A- tolerance **B-** withdrawal **C-** dependence **D-** effective dose

37-In skeletal muscle the tissue that bounds together a group of fascicles is a(an): -

A- epithelial tissues **B-** nervous tissue **C-** muscle tissue **D-** connective tissue

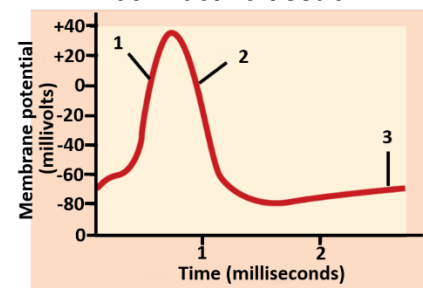

38- Which point on the graph represents when the voltage-gated sodium channels are open?

A- only 1

B- 1 and 3

C- only 3

D- 2 and 3

39-Which of the following is correct about red blood cells?

A- immature red blood cells synthesize large amounts of hemoglobin
B- their cell nucleus and organelles disintegrate **C-** they form antibodies **D-** both (A and B) are correct

40-In which of the following states of the monohybrid crosses ,50% of the resulting individuals are recessive?

A- If both parents are homozygous and dominant
B- If one of the parents is recessive and the other is heterozygous
C- If one of the parents is homozygous and dominant and the other is heterozygous
D- If both parents are heterozygous

41-If the probability that a specific trait will appear in a generation is ($\frac{3}{16}$) and the number of individuals for this trait is (300) individuals, what is the total number of individuals in this generation?

A- 300 individuals **B-** 800 individuals **C-** 1600 individuals **D-** 2400 individuals

42-Which of the following is INCORRECT?

A- the codon AUG specifies the amino acid methionine in genetic code.

B- the number of anti-codons is 61 anti-codons.

C- the number of codons that specify amino acids is 61 codons

D- the codon GCU, which specifies the amino acid alanine in genetic code, can specify another different amino acid

43-Which of the following represents the sequence that was used to transcribed this sequence

(CUC AAG UGC UUC) of mRNA?

A- CUCAAGUGCUUC **B-** GAGUUCACGAAG **C-** GAGTTCACGAAG **D-** AGACCTGTAGGA

44-In which of the following crosses the ratio of genotype and the ratio of phenotype of the resulting individuals are equal?

A- the cross between two heterozygous individuals in incomplete dominance

B- monohybrid cross between two heterozygous individuals in complete dominance

C- dihybrid cross between two homozygous individuals for both characteristics in complete dominance

D- both (A and C) are correct

45-Avery and his colleagues' experiments found that the cells.....unable to convert R cells into S cells.

A- missing DNA **B-** containing DNA **C-** missing protein **D-** missing RNA

46-Based on the adjacent table, that shows the ratio

of nitrogen bases in humans, virus X, and wheat,

which of the following choices is correct:

	Adenine(A)	Thymine(T)	Guanine(G)	Cytosine(C)
Human	30.4	30.1	19.6	19.9
X virus	34.2	25.8	13.8	26.2
Wheat	27.3	27.1	22.7	22.8

A- DNA in X virus is single-stranded DNA

B- DNA in human, X virus, and wheat are in the form of a double helix. .

C- the ratio of purines to pyrimidines in human, X virus and wheat is 1:1.

D- all of them are correct

47-In complete dominance the trait of smooth seeds appears when its genotype is.....,but the trait of the terminal flower appears when its genotype is.....

A- only homozygous, only heterozygous **B-** only heterozygous, only homozygous

C- homozygous or heterozygous, only homozygous **D-** only heterozygous, homozygous or heterozygous

48-In each replication fork there are:-

A- two helicases and one DNA polymerase

B- one helicase and two DNA polymerases

C- one helicase and one DNA polymerase

D- two helicases and two DNA polymerases

49- In the process of DNA replication: -

A- the number of purines in one of the new strands is equal to the number of pyrimidines in the other new strand

B- the number of pyrimidines in one of the new strands is equal to the number of pyrimidines in the other new strand

C- each original strand serves as a template to make an identical strand as itself **D-** both (A and C) are correct

50-Considering the three components of a nucleotide, how many nucleotides are identical (which have the exact same structure) in both DNA and RNA?

A- zero

B- 2

C- 3

D- 4

Note: choose the correct answer:

(2 marks for each right answer)

1-In the primary and secondary immune responses: -

- A- memory cells are produced B- antibodies are produced
C- antigens are attacked D- all of them are correct

2-Tobacco: -

- A- contains no substance that causes addiction B- causes chronic bronchitis
C- burning of it produces tars that paralyzes the cilia that line the respiratory tracts D- both (B and C) are correct

3-The male reproductive system structure that lies between the bladder and the rectum, produces a fluid: -

- A- rich in sugars B- that neutralizes the acids in the female reproductive system
C- that neutralizes traces of acidic urine in the urethra D- all of them are incorrect

4-Uterus contains target cells for which of the following hormones?

- A- estrogen B- progesterone C- oxytocin D- all of them are correct

5-Which of the following is correct regarding the Schwann cell?

- A- transmits nerve impulses from the cell body towards the nerve endings
B- produces the myelin around the axon of neurons that are not found in the brain or in the spinal cord
C- receives stimuli from other neurons and transmits them towards the nerve endings
D- produces the myelin around the axon of all neurons

6- The adjacent figure shows which of the following?

- A- a Haversian canal that is surrounded by lamellae in compact bone.
B- a spongy bone that has a latticework structure.
C- a periosteum that contains a network of blood vessels.
D- a long bone cavity that contains the yellow bone marrow.

7-Which of the following pairs are correctly matched? A- macrophages : display antigens on its surface

- B- complement system proteins : are released by cells infected with virus
C- stomach acids : are specific defenses D- thymus : helps produce all kinds of lymphocytes.

8-In the process of hearing which of the following releases neurotransmitters?

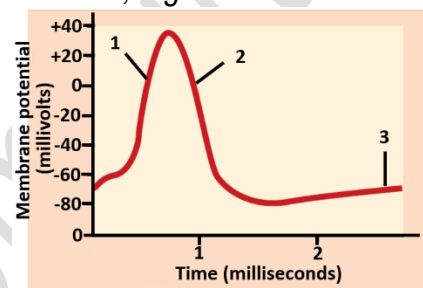

- A- the hair cells B- the fluid inside the cochlea
C- the membrane that covers the hair cells D- the bottom membrane of the middle chamber

9-During inspiration, the diaphragm....., causing the air pressure inside the lungsthan the air pressure outside the body: -

- A- flattens, lower B- contracts, higher
C- relaxes, lower D- flattens, higher

10- Which point on the graph represents when the voltage-gated sodium channels are open?

- A- only 1
B- 1 and 3
C- only 3
D- 2 and 3

11-Which of the following is **incorrect** for a relaxed muscle?

- A- the length of the actin and the myosin filaments does not change in comparison to a contracted muscle
B- the actin and myosin filaments overlap C- the actin and myosin filaments slide past each other
D- all of them are incorrect.

12-The similarity between the mechanism of action of amino acid-based hormones and the mechanism of action of thyroid hormones is that both mechanisms need to: -

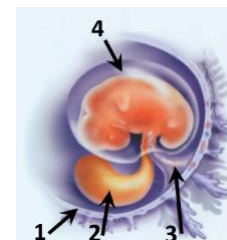

- A- target cell B- second messenger C- bind to its own receptor D- both (A and C) are correct

13-Which of the following often results in addiction?

- A- tolerance B- withdrawal C- dependence D- effective dose

14- In the adjacent figure, which number points to the membrane that surrounds all of the other embryonic membranes ?

- A- 1
B- 2
C- 3
D- 4

15-Which of the following is **incorrect**?

- (1- Only artery carries oxygenated blood, 2- The artery and the vein both have an inner layer of endothelial tissue, 3- The artery divides into smaller blood vessels until they end in capillaries, 4- Only vein carries deoxygenated blood).
A- 1, 3, 4 B- 1, 4 C- 1, 2, 4 D- 2, 3, 4

16-Epiphyseal plate is **NOT** found at the ends of immature: -

- A- fibula bone B- skull bones C- humerus bone D- tibia bone

17-Which of the following is correct about red blood cells?

- A- immature red blood cells synthesize large amounts of hemoglobin
B- their cell nucleus and organelles disintegrate C- they form antibodies D- both (A and B) are correct

18-What is the role of the follicle-stimulating hormone in humans?

- A- along with testosterone, stimulates sperm production B- stimulates the secretion of testosterone
C- stimulates cell division in a follicle D- both (A and C) are correct

19-Which of the following is correct regarding the Langerhans Islands?

- A- secrete two amino acid-based hormones that lower the blood sugar level
B- contain mostly exocrine cells C- function as an endocrine gland. D- all of them are correct

20-One of the following is secreted by a ductal gland:-

- A- aldosterone B- human chorionic gonadotropin C- cortisol D- lysozyme

21-Opportunistic infections: -

- A- can be considered as evidence that the HIV infection has progressed to AIDS
B- the organisms of these diseases usually do not create problems in people with a healthy immune system
C- appear in phase I of HIV infection D- both (A and B) are correct

22-The cardiovascular system differs from the lymphatic system in that the cardiovascular system:

- A- is a part of the circulatory system B- contains red blood cells
C- its vessels are one-way that transport the fluid it contains from the tissues to the heart
D- contains lymphocytes

23-All of the following are correct about chemical receptors, **EXCEPT**:

- A- are neurons that detect stimuli B- are clustered in taste buds
C- are found in the mucous lining of the epithelium in the nasal passages
D- the action potentials they produce are interpreted only in the parietal lobe of the cerebral cortex

24-Which of the following directs most incoming sensory signals to the proper region of the cerebral cortex:

- A- midbrain B- medulla oblongata C- pons D- thalamus

25-Which of the following are the characteristics of the atrioventricular node?

- (1- It is located in the septum between the two ventricles, 2- it relays the electrical impulse to the muscle cells that make up the ventricles, 3- it regulates the rate of contraction of the entire heart, 4- it initiates an electrical impulse and causes a QRS wave in the electrocardiograph(ECG))
A- 1, 3, 4 B- 2, 4 C- 1, 2, 4 D- 2, 3, 4

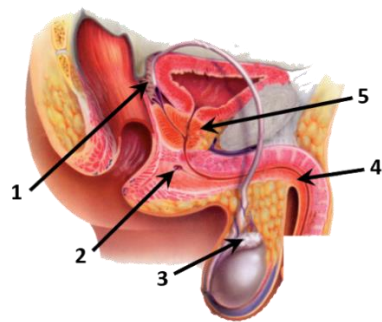

26-In this blood transfusion process $AB^+ \rightarrow O^-$:-

- (1- anti-Rh antibodies will react with Rh antigens ,2- anti-A antibodies will react with A antigens, 3- anti-B antibodies will react with B antigens)
A- 1, 2 B- 1, 2, 3, C- 1, 3 D- 2, 3

27-In phase II of HIV infection, all of the following occur **EXCEPT**:-

- A- the virus continues to replicate. B- helper T cells can no longer stimulate B cells.
C- B cells continue to make a large amount of antibody against HIV
D- The number of helper T cells drops steadily

28-Which structures of the adjacent figure are **NOT** within the path taken by the sperm as they leave the body?

- A- 2, 3, 5
 - B- 2, 3, 4
 - C- 1, 2, 5
 - D- 1, 2, 4
- 29-Plasma cells: -
- A- secrete antibodies
 - B- create holes in the membranes of the infected cells
 - C- make antibodies
 - D- both (A and C) are correct

30-When the, in the blood the sensors in the brain send a message to the respiratory muscles to return to a slower breathing rate.

- A- carbon dioxide concentration decreases
- B- carbon dioxide concentration increases
- C- the oxygen and carbon dioxide concentration increase
- D- the oxygen concentration decreases

31-Which of the following is a function of the long bone:

- A- its ability to contract and relax enables the body to move
- B- produces platelets
- C- helps the body to maintain a constant temperature
- D- all of them are correct

32-In the axial skeleton, the red bone marrow is found in the:-

- A- scapula
- B- clavicle
- C- sternum
- D- both (B and C) are correct

33-The smooth muscle differs from the skeletal muscle in that the smooth muscle: -

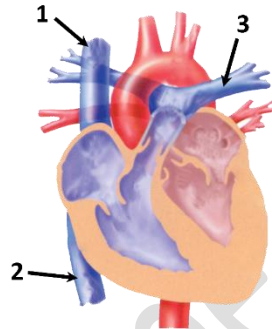

- A- has origin and insertion points
- B- is striated
- C- forms the walls of the internal organs
- D- is voluntary

34-Which of the following is correct regarding the cerebellum?

- A- it lies below and before the cerebral hemispheres
- B- the surface of cerebellum is highly folded
- C- It receives motor impulses coming from the ears
- D- all of them are correct

35-Depending on the adjacent figure, all blood vessels that are labeled by numbers 1, 2, 3: -

- A- are veins
- B- carry deoxygenated blood to the heart
- C- their walls are made up of three layers
- D- both (A and C) are correct

36-Both natural killer cells and inhibitory T cells

- A- are white blood cells.
- B- play a part in humoral immune response.
- C- carry antigens of pathogen on their surfaces
- D- both (A and C) are correct

37-How many different genotypes can result from a dihybrid cross between two pea plants? If you know that one plant is a heterozygous of both traits and the other is unknown genotype, and that the ratio of heterozygous individuals for the two traits resulting from this cross is 25%.

- A- 2
- B- 4
- C- 8
- D- all of them are incorrect

38-Which of the following does **NOT** occur during the first trimester of pregnancy?

- A- the legs, eyes, and ears have begun to develop
- B- the fetus can react to loud sounds.
- C- fingers are formed.
- D- the heart begins to beat.

39-In skeletal muscle the tissue that bounds together a group of fascicles is a(an): -

- A- epithelial tissues
- B- nervous tissue
- C- muscle tissue
- D- connective tissue

40-In which of the following states of the monohybrid crosses ,50% of the resulting individuals are recessive?

- A- If both parents are homozygous and dominant
- B- If one of the parents is recessive and the other is heterozygous
- C- If one of the parents is homozygous and dominant and the other is heterozygous
- D- If both parents are heterozygous

41-Considering the three components of a nucleotide, how many nucleotides are identical (which have the exact same structure) in both DNA and RNA?

- A- zero
- B- 2
- C- 3
- D- 4

42-Which of the following is **INCORRECT**?

- A- the codon AUG specifies the amino acid methionine in genetic code.
- B- the number of anti-codons is 61 anti-codons.
- C- the number of codons that specify amino acids is 61 codons
- D- the codon GCU, which specifies the amino acid alanine in genetic code, can specify another different amino acid

43-Avery and his colleagues' experiments found that the cells.....unable to convert R cells into S cells.

- A- missing DNA
- B- containing DNA
- C- missing protein
- D- missing RNA

44-If the probability that a specific trait will appear in a generation is ($\frac{3}{16}$) and the number of individuals for this trait is (300) individuals, what is the total number of individuals in this generation?

- A- 300 individuals
- B- 800 individuals
- C- 1600 individuals
- D- 2400 individuals

45-In complete dominance the trait of smooth seeds appears when its genotype is.....,but the trait of the terminal flower appears when its genotype is.....

- A- only homozygous, only heterozygous
- B- only heterozygous, only homozygous
- C- homozygous or heterozygous, only homozygous
- D- only heterozygous, homozygous or heterozygous

46-Based on the adjacent table, that shows the ratio of nitrogen bases in humans, virus X, and wheat, which of the following choices is correct:

	Adenine(A)	Thymine(T)	Guanine(G)	Cytosine(C)
Human	30.4	30.1	19.6	19.9
X virus	34.2	25.8	13.8	26.2
Wheat	27.3	27.1	22.7	22.8

- A- DNA in X virus is single-stranded DNA
- B- DNA in human, X virus, and wheat are in the form of a double helix. .
- C- the ratio of purines to pyrimidines in human, X virus and wheat is 1:1.
- D- all of them are correct

47-In which of the following crosses the ratio of genotype and the ratio of phenotype of the resulting individuals are equal?

- A- the cross between two heterozygous individuals in incomplete dominance
- B- monohybrid cross between two heterozygous individuals in complete dominance
- C- dihybrid cross between two homozygous individuals for both characteristics in complete dominance
- D- both (A and C) are correct

48-Which of the following represents the sequence that was used to transcribed this sequence (CUC AAG UGC UUC) of mRNA?

- A- CUCAAGUGCUUC
- B- GAGUUCACGAAG
- C- GAGTTCACGAAG
- D- AGACCTGTAGGA

49- In the process of DNA replication: -

- A-the number of purines in one of the new strands is equal to the number of pyrimidines in the other new strand
- B-the number of pyrimidines in one of the new strands is equal to the number of pyrimidines in the other new strand
- C-each original strand serves as a template to make an identical strand as itself
- D- both (A and C) are correct

50-In each replication fork there are:-

- A- two helicases and one DNA polymerase
- B- one helicase and two DNA polymerases
- C- one helicase and one DNA polymerase
- D- two helicases and two DNA polymerases

Note: choose the correct answer:

(2 marks for each right answer)

1-Which of the following is a function of the long bone:

- A- its ability to contract and relax enables the body to move
B- produces platelets
C- helps the body to maintain a constant temperature
D- all of them are correct

2-Which of the following are the characteristics of the atrioventricular node?

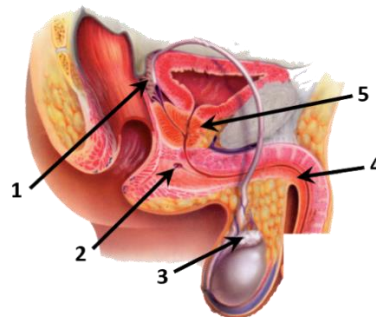

(1- It is located in the septum between the two ventricles, 2- it relays the electrical impulse to the muscle cells that make up the ventricles, 3- it regulates the rate of contraction of the entire heart, 4- it initiates an electrical impulse and causes a QRS wave in the electrocardiograph(ECG))

- A- 1, 3, 4
B- 2, 4
C- 1, 2, 4
D- 2, 3, 4

3-Which structures of the adjacent figure are **NOT** within the path taken

by the sperm as they leave the body?

- A- 2, 3, 5
B- 2, 3, 4
C- 1, 2, 5
D- 1, 2, 4

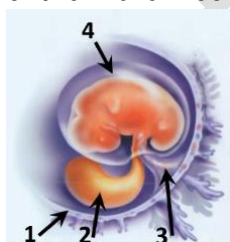

4-Both natural killer cells and inhibitory T cells

- A- are white blood cells.
B- play a part in humoral immune response.
C- carry antigens of pathogen on their surfaces
D- both (A and C) are correct

5-How many different genotypes can result from a dihybrid cross between two pea plants? If you know that one plant is a heterozygous of both traits and the other is unknown genotype, and that the ratio of heterozygous individuals for the two traits resulting from this cross is 25%.

- A- 2
B- 4
C- 8
D- all of them are incorrect

6- In the adjacent figure, which number points to the membrane that surrounds all of the other embryonic membranes ?

- A- 1
B- 2
C- 3
D- 4

7-In skeletal muscle the tissue that bounds together a group of fascicles is a(an): -

- A- epithelial tissues
B- nervous tissue
C- muscle tissue
D- connective tissue

8-Uterus contains target cells for which of the following hormones?

- A- estrogen
B- progesterone
C- oxytocin
D- all of them are correct

9-During inspiration, the diaphragm....., causing the air pressure inside the lungsthan the air pressure outside the body: -

- A- flattens, lower
B- contracts, higher
C- relaxes, lower
D- flattens, higher

10-Which of the following is correct regarding the cerebellum?

- A- it lies below and before the cerebral hemispheres
B- the surface of cerebellum is highly folded
C- It receives motor impulses coming from the ears
D- all of them are correct

11-Which of the following is correct regarding the Schwann cell?

- A- transmits nerve impulses from the cell body towards the nerve endings
B- produces the myelin around the axon of neurons that are not found in the brain or in the spinal cord
C- receives stimuli from other neurons and transmits them towards the nerve endings
D- produces the myelin around the axon of all neurons

12-Which of the following is correct regarding the Langerhans Islands?

- A- secrete two amino acid-based hormones that lower the blood sugar level
B- contain mostly exocrine cells
C- function as an endocrine gland.
D- all of them are correct

13-Which of the following is **incorrect** for a relaxed muscle?

- A- the length of the actin and the myosin filaments does not change in comparison to a contracted muscle
B- the actin and myosin filaments overlap
C- the actin and myosin filaments slide past each other
D- all of them are incorrect.

14-The smooth muscle differs from the skeletal muscle in that the smooth muscle: -

- A- has origin and insertion points
B- is striated
C- forms the walls of the internal organs
D- is voluntary

15-Which of the following is **incorrect**?

(1- Only artery carries oxygenated blood, 2- The artery and the vein both have an inner layer of endothelial tissue, 3- The artery divides into smaller blood vessels until they end in capillaries, 4- Only vein carries deoxygenated blood).

- A- 1, 3, 4
B- 1, 4
C- 1, 2, 4
D- 2, 3, 4

16-The cardiovascular system differs from the lymphatic system in that the cardiovascular system:

- A- is a part of the circulatory system
B- contains red blood cells
C- its vessels are one-way that transport the fluid it contains from the tissues to the heart
D- contains lymphocytes

17-Tobacco: -

- A- contains no substance that causes addiction
B- causes chronic bronchitis
C- burning of it produces tars that paralyzes the cilia that line the respiratory tracts
D- both (B and C) are correct

18-When the, in the blood the sensors in the brain send a message to the respiratory muscles to return to a slower breathing rate.

- A- carbon dioxide concentration decreases
B- carbon dioxide concentration increases
C- the oxygen and carbon dioxide concentration increase
D- the oxygen concentration decreases

19-Epiphyseal plate is **NOT** found at the ends of immature: -

- A- fibula bone
B- skull bones
C- humerus bone
D- tibia bone

20-In the process of hearing which of the following releases neurotransmitters?

- A- the hair cells
B- the fluid inside the cochlea
C- the membrane that covers the hair cells
D- the bottom membrane of the middle chamber

21-Plasma cells: -

- A- secrete antibodies
B- create holes in the membranes of the infected cells
C- make antibodies
D- both (A and C) are correct

22-Which of the following is correct about red blood cells?

- A- immature red blood cells synthesize large amounts of hemoglobin
B- their cell nucleus and organelles disintegrate
C- they form antibodies
D- both (A and B) are correct

23-The similarity between the mechanism of action of amino acid-based hormones and the mechanism of action of thyroid hormones is that both mechanisms need to: -

- A- target cell
B- second messenger
C- bind to its own receptor
D- both (A and C) are correct

24-Opportunistic infections: -

- A- can be considered as evidence that the HIV infection has progressed to AIDS
B- the organisms of these diseases usually do not create problems in people with a healthy immune system
C- appear in phase I of HIV infection
D- both (A and B) are correct

25-The male reproductive system structure that lies between the bladder and the rectum, produces a fluid: -

- A- rich in sugars
B- that neutralizes the acids in the female reproductive system
C- that neutralizes traces of acidic urine in the urethra
D- all of them are incorrect

26-Which of the following pairs are correctly matched? A- macrophages : display antigens on its surface

- B- complement system proteins : are released by cells infected with virus
C- stomach acids : are specific defenses
D- thymus : helps produce all kinds of lymphocytes.

27-In phase II of HIV infection, all of the following occur **EXCEPT**: -

- A- the virus continues to replicate.
B- helper T cells can no longer stimulate B cells.
C- B cells continue to make a large amount of antibody against HIV
D- The number of helper T cells drops steadily

28- The adjacent figure shows which of the following?

- A- a Haversian canal that is surrounded by lamellae in compact bone.
- B- a spongy bone that has a latticework structure.
- C- a periosteum that contains a network of blood vessels.
- D- a long bone cavity that contains the yellow bone marrow.

29-Which of the following directs most incoming sensory signals to the proper region of the cerebral cortex:

- A- midbrain
- B- medulla oblongata
- C- pons
- D- thalamus

30-Which of the following often results in addiction?

- A- tolerance
- B- withdrawal
- C- dependence
- D- effective dose

31-What is the role of the follicle-stimulating hormone in humans?

- A- along with testosterone, stimulates sperm production
- B- stimulates the secretion of testosterone
- C- stimulates cell division in a follicle
- D- both (A and C) are correct

32-In the axial skeleton, the red bone marrow is found in the:-

- A- scapula
- B- clavicle
- C- sternum
- D- both (B and C) are correct

33-Which of the following does **NOT** occur during the first trimester of pregnancy?

- A- the legs, eyes, and ears have begun to develop
- B- the fetus can react to loud sounds.
- C- fingers are formed.
- D- the heart begins to beat.

34-All of the following are correct about chemical receptors, **EXCEPT**:

- A- are neurons that detect stimuli
- B- are clustered in taste buds
- C- are found in the mucous lining of the epithelium in the nasal passages
- D- the action potentials they produce are interpreted only in the parietal lobe of the cerebral cortex

35-One of the following is secreted by a ductal gland:-

- A- aldosterone
- B- human chorionic gonadotropin
- C- cortisol
- D- lysozyme

36-In this blood transfusion process $AB^+ \longrightarrow O^-$:-

(1- anti-Rh antibodies will react with Rh antigens ,2- anti-A antibodies will react with A antigens, 3- anti-B antibodies will react with B antigens)

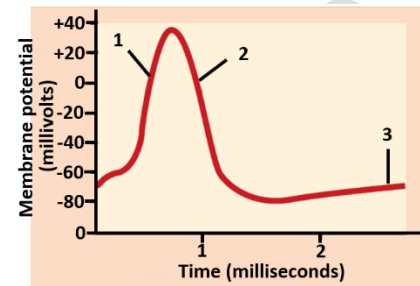

- A- 1 , 2
- B- 1 , 2 , 3,
- C- 1 , 3
- D- 2 , 3

37-In the primary and secondary immune responses: -

- A- memory cells are produced
- B- antibodies are produced
- C- antigens are attacked
- D- all of them are correct

38- Which point on the graph represents when the voltage-gated sodium channels are open?

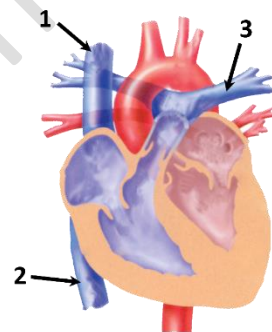

- A- only 1
- B- 1 and 3
- C- only 3
- D- 2 and 3

39-Depending on the adjacent figure, all blood vessels

that are labeled by numbers 1, 2, 3: -

- A- are veins
- B- carry deoxygenated blood to the heart
- C- their walls are made up of three layers
- D- both (A and C) are correct

40-In which of the following states of the monohybrid crosses ,50% of the resulting individuals are recessive?

- A- If both parents are homozygous and dominant
- B- If one of the parents is recessive and the other is heterozygous
- C- If one of the parents is homozygous and dominant and the other is heterozygous
- D- If both parents are heterozygous

41-Considering the three components of a nucleotide, how many nucleotides are identical (which have the exact same structure) in both DNA and RNA?

- A- zero
- B- 2
- C- 3
- D- 4

42-In which of the following crosses the ratio of genotype and the ratio of phenotype of the resulting individuals are equal?

- A- the cross between two heterozygous individuals in incomplete dominance
- B- monohybrid cross between two heterozygous individuals in complete dominance
- C- dihybrid cross between two homozygous individuals for both characteristics in complete dominance
- D- both (A and C) are correct

43-In complete dominance the trait of smooth seeds appears when its genotype is.....,but the trait of the terminal flower appears when its genotype is.....

- A- only homozygous, only heterozygous
- B- only heterozygous, only homozygous
- C- homozygous or heterozygous, only homozygous
- D- only heterozygous, homozygous or heterozygous

44-If the probability that a specific trait will appear in a generation is ($\frac{3}{16}$) and the number of individuals for this trait is (300) individuals, what is the total number of individuals in this generation?

- A- 300 individuals
- B- 800 individuals
- C- 1600 individuals
- D- 2400 individuals

45- In the process of DNA replication: -

- A- the number of purines in one of the new strands is equal to the number of pyrimidines in the other new strand
- B- the number of pyrimidines in one of the new strands is equal to the number of pyrimidines in the other new strand
- C- each original strand serves as a template to make an identical strand as itself
- D- both (A and C) are correct

46-Which of the following represents the sequence that was used to transcribed this sequence (CUC AAG UGC UUC) of mRNA?

- A- CUCAAGUGCUUC
- B- GAGUUCACGAAG
- C- GAGTTCACGAAG
- D- AGACCTGTAGGA

47-Based on the adjacent table, that shows the ratio of nitrogen bases in humans, virus X, and wheat, which of the following choices is correct:

	Adenine(A)	Thymine(T)	Guanine(G)	Cytosine(C)
Human	30.4	30.1	19.6	19.9
X virus	34.2	25.8	13.8	26.2
Wheat	27.3	27.1	22.7	22.8

- A- DNA in X virus is single-stranded DNA
- B- DNA in human, X virus, and wheat are in the form of a double helix. .
- C- the ratio of purines to pyrimidines in human, X virus and wheat is 1:1.
- D- all of them are correct

48-Avery and his colleagues' experiments found that the cells.....unable to convert R cells into S cells.

- A- missing DNA
- B- containing DNA
- C- missing protein
- D- missing RNA

49-In each replication fork there are:-

- A- two helicases and one DNA polymerase
- B- one helicase and two DNA polymerases
- C- one helicase and one DNA polymerase
- D- two helicases and two DNA polymerases

50-Which of the following is **INCORRECT**?

- A- the codon AUG specifies the amino acid methionine in genetic code.
- B- the number of anti-codons is 61 anti-codons.
- C- the number of codons that specify amino acids is 61 codons
- D- the codon GCU, which specifies the amino acid alanine in genetic code, can specify another different amino acid

Note: choose the correct answer:

(2 marks for each right answer)

1-Which of the following is **incorrect** for a relaxed muscle?

- A- the length of the actin and the myosin filaments does not change in comparison to a contracted muscle
B- the actin and myosin filaments overlap C- the actin and myosin filaments slide past each other
D- all of them are incorrect.

2-Which of the following is correct regarding the Langerhans Islands?

- A- secrete two amino acid-based hormones that lower the blood sugar level
B- contain mostly exocrine cells C- function as an endocrine gland. D- all of them are correct

3-Which of the following does **NOT** occur during the first trimester of pregnancy?

- A- the legs, eyes, and ears have begun to develop B- the fetus can react to loud sounds.
C- fingers are formed. D- the heart begins to beat.

4-Tobacco: -

- A- contains no substance that causes addiction B- causes chronic bronchitis
C- burning of it produces tars that paralyzes the cilia that line the respiratory tracts D- both (B and C) are correct

5-In this blood transfusion process $AB^+ \longrightarrow O^-$:-

- (1- anti-Rh antibodies will react with Rh antigens ,2- anti-A antibodies will react with A antigens, 3- anti-B antibodies will react with B antigens)

- A- 1 , 2 B- 1 , 2 , 3, C- 1 , 3 D-.2 , 3

6-In phase II of HIV infection, all of the following occur **EXCEPT** :-

- A- the virus continues to replicate. B- helper T cells can no longer stimulate B cells.
C- B cells continue to make a large amount of antibody against HIV
D- The number of helper T cells drops steadily

7-Both natural killer cells and inhibitory T cells

- A- are white blood cells. B- play a part in humoral immune response.
C- carry antigens of pathogen on their surfaces D- both (A and C) are correct

8-Which of the following is a function of the long bone:

- A- its ability to contract and relax enables the body to move B- produces platelets
C- helps the body to maintain a constant temperature D- all of them are correct

9-Epiphyseal plate is **NOT** found at the ends of immature: -.

- A- fibula bone B- skull bones C- humerus bone D- tibia bone

10-How many different genotypes can result from a dihybrid cross between two pea plants? If you know that one plant is a heterozygous of both traits and the other is unknown genotype, and that the ratio of heterozygous individuals for the two traits resulting from this cross is 25%.

- A- 2 B- 4 C.- 8 D- all of them are incorrect

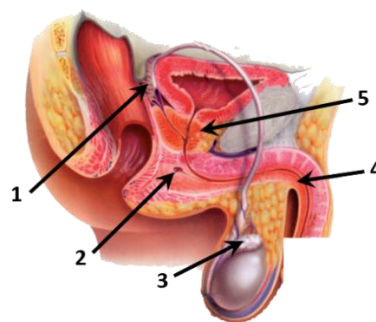

11-The smooth muscle differs from the skeletal muscle in that the smooth muscle: -

- A- has origin and insertion points B- is striated C- forms the walls of the internal organs D- is voluntary

12-Which structures of the adjacent figure are **NOT** within the path taken

by the sperm as they leave the body?

- A- 2, 3, 5
B- 2, 3, 4
C- 1, 2, 5
D- 1, 2, 4

13-Which of the following is correct regarding the cerebellum?

- A- it lies below and before the cerebral hemispheres B- the surface of cerebellum is highly folded
C- It receives motor impulses coming from the ears D- all of them are correct

14- The adjacent figure shows which of the following?

- A- a Haversian canal that is surrounded by lamellae in compact bone.
B- a spongy bone that has a latticework structure.
C- a periosteum that contains a network of blood vessels.
D- a long bone cavity that contains the yellow bone marrow.

15-Which of the following is correct about red blood cells?

- A- immature red blood cells synthesize large amounts of hemoglobin
B- their cell nucleus and organelles disintegrate C- they form antibodies D- both (A and B) are correct

16-What is the role of the follicle-stimulating hormone in humans?

- A- along with testosterone, stimulates sperm production B- stimulates the secretion of testosterone
C- stimulates cell division in a follicle D- both (A and C) are correct

17-One of the following is secreted by a ductal gland:-

- A- aldosterone B- human chorionic gonadotropin C- cortisol D- lysozyme

18-The male reproductive system structure that lies between the bladder and the rectum, produces a fluid: -

- A- rich in sugars B- that neutralizes the acids in the female reproductive system
C- that neutralizes traces of acidic urine in the urethra D- all of them are incorrect

19-The cardiovascular system differs from the lymphatic system in that the cardiovascular system:

- A- is a part of the circulatory system B- contains red blood cells
C- its vessels are one-way that transport the fluid it contains from the tissues to the heart
D- contains lymphocytes

20-During inspiration, the diaphragm....., causing the air pressure inside the lungsthan the air pressure outside the body: -

- A- flattens, lower B- contracts, higher
C- relaxes, lower D- flattens, higher

21-In skeletal muscle the tissue that bounds together a group of fascicles is a(an): -

- A- epithelial tissues B- nervous tissue C- muscle tissue D- connective tissue

22-In the primary and secondary immune responses: -

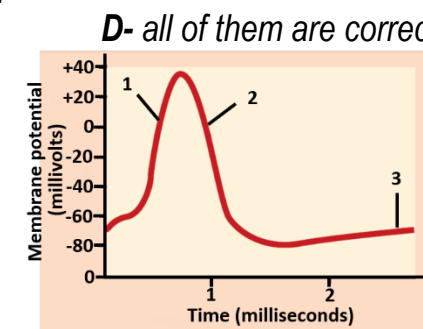

- A- memory cells are produced B- antibodies are produced
C- antigens are attacked D- all of them are correct

23-Uterus contains target cells for which of the following hormones?

- A- estrogen B- progesterone C- oxytocin D- all of them are correct

24- Which point on the graph represents when the voltage-gated sodium channels are open?

- A- only 1
B- 1 and 3
C- only 3
D- 2 and 3

25-Opportunistic infections: -

- A- can be considered as evidence that the HIV infection has progressed to AIDS
B- the organisms of these diseases usually do not create problems in people with a healthy immune system
C- appear in phase I of HIV infection D- both (A and B) are correct

26-Which of the following is correct regarding the Schwann cell?

- A- transmits nerve impulses from the cell body towards the nerve endings
B- produces the myelin around the axon of neurons that are not found in the brain or in the spinal cord
C- receives stimuli from other neurons and transmits them towards the nerve endings
D- produces the myelin around the axon of all neurons

27-Plasma cells: -

- A- secrete antibodies B- create holes in the membranes of the infected cells
C- make antibodies D- both (A and C) are correct

28-Which of the following pairs are correctly matched? A- macrophages : display antigens on its surface

- B- complement system proteins : are released by cells infected with virus
C- stomach acids : are specific defenses D- thymus : helps produce all kinds of lymphocytes.

29-All of the following are correct about chemical receptors, **EXCEPT**:

- A-** are neurons that detect stimuli **B-** are clustered in taste buds
C- are found in the mucous lining of the epithelium in the nasal passages
D- the action potentials they produce are interpreted only in the parietal lobe of the cerebral cortex

30-The similarity between the mechanism of action of amino acid-based hormones and the mechanism of action of thyroid hormones is that both mechanisms need to: -

- A-** target cell **B-** second messenger **C-** bind to its own receptor **D-** both (A and C) are correct

31-Which of the following are the characteristics of the atrioventricular node?

- (1- It is located in the septum between the two ventricles, 2- it relays the electrical impulse to the muscle cells that make up the ventricles, 3- it regulates the rate of contraction of the entire heart, 4- it initiates an electrical impulse and causes a QRS wave in the electrocardiograph(ECG))

- A-** 1, 3, 4 **B-** 2, 4 **C-** 1, 2, 4 **D-** 2, 3, 4

32-Which of the following is **incorrect**?

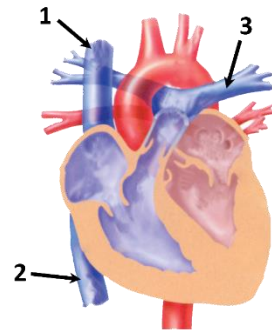

- (1- Only artery carries oxygenated blood, 2- The artery and the vein both have an inner layer of endothelial tissue, 3- The artery divides into smaller blood vessels until they end in capillaries, 4- Only vein carries deoxygenated blood).

- A-** 1, 3, 4 **B-** 1, 4 **C-** 1, 2, 4 **D-** 2, 3, 4

33-Depending on the adjacent figure, all blood vessels

that are labeled by numbers 1, 2, 3: -

- A-** are veins
B- carry deoxygenated blood to the heart
C- their walls are made up of three layers
D- both (A and C) are correct

34-Which of the following often results in addiction?

- A-** tolerance **B-** withdrawal **C-** dependence **D-** effective dose

35-When the, in the blood the sensors in the brain send a message to the respiratory muscles to return to a slower breathing rate.

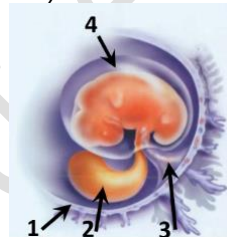

- A-** carbon dioxide concentration decreases **B-** carbon dioxide concentration increases
C- the oxygen and carbon dioxide concentration increase **D-** the oxygen concentration decreases

36-In the axial skeleton, the red bone marrow is found in the:-

- A-** scapula **B-** clavicle **C-** sternum **D-** both (B and C) are correct

37- In the adjacent figure, which number points to the membrane that surrounds all of the other embryonic membranes ?

- A-** 1
B- 2
C- 3
D- 4

38-In the process of hearing which of the following releases neurotransmitters?

- A-** the hair cells **B-** the fluid inside the cochlea
C- the membrane that covers the hair cells **D-** the bottom membrane of the middle chamber

39-Which of the following directs most incoming sensory signals to the proper region of the cerebral cortex:

- A-** midbrain **B-** medulla oblongata **C-** pons **D-** thalamus

40-In which of the following states of the monohybrid crosses ,50% of the resulting individuals are recessive?

- A-** If both parents are homozygous and dominant
B- If one of the parents is recessive and the other is heterozygous
C- If one of the parents is homozygous and dominant and the other is heterozygous
D- If both parents are heterozygous

41-Considering the three components of a nucleotide, how many nucleotides are identical (which have the exact same structure) in both DNA and RNA?

- A-** zero **B-** 2 **C-** 3 **D-** 4

42-In complete dominance the trait of smooth seeds appears when its genotype is.....,but the trait of the terminal flower appears when its genotype is.....

- A-** only homozygous, only heterozygous **B-** only heterozygous, only homozygous
C- homozygous or heterozygous, only homozygous **D-** only heterozygous, homozygous or heterozygous

43-Which of the following is **INCORRECT**?

- A-** the codon AUG specifies the amino acid methionine in genetic code.
B- the number of anti-codons is 61 anti-codons.
C- the number of codons that specify amino acids is 61 codons
D- the codon GCU, which specifies the amino acid alanine in genetic code, can specify another different amino acid

44-Which of the following represents the sequence that was used to transcribed this sequence (CUC AAG UGC UUC) of mRNA?

- A-** CUCAAGUGCUUC **B-** GAGUUCACGAAG **C-** GAGTTCACGAAG **D-** AGACCTGTAGGA

45-In which of the following crosses the ratio of genotype and the ratio of phenotype of the resulting individuals are equal?

- A-** the cross between two heterozygous individuals in incomplete dominance
B- monohybrid cross between two heterozygous individuals in complete dominance
C- dihybrid cross between two homozygous individuals for both characteristics in complete dominance
D- both (A and C) are correct

46-Based on the adjacent table, that shows the ratio of nitrogen bases in humans, virus X, and wheat, which of the following choices is correct:

	Adenine(A)	Thymine(T)	Guanine(G)	Cytosine(C)
Human	30.4	30.1	19.6	19.9
X virus	34.2	25.8	13.8	26.2
Wheat	27.3	27.1	22.7	22.8

- A-** DNA in X virus is single-stranded DNA
B- DNA in human, X virus, and wheat are in the form of a double helix. .
C- the ratio of purines to pyrimidines in human, X virus and wheat is 1:1.
D- all of them are correct

47-If the probability that a specific trait will appear in a generation is ($\frac{3}{16}$) and the number of individuals for this trait is (300) individuals, what is the total number of individuals in this generation?

- A-** 300 individuals **B-** 800 individuals **C-** 1600 individuals **D-** 2400 individuals

48- In the process of DNA replication: -

- A-** the number of purines in one of the new strands is equal to the number of pyrimidines in the other new strand
B- the number of pyrimidines in one of the new strands is equal to the number of pyrimidines in the other new strand
C- each original strand serves as a template to make an identical strand as itself **D-** both (A and C) are correct

49-In each replication fork there are:-

- A-** two helicases and one DNA polymerase **B-** one helicase and two DNA polymerases
C- one helicase and one DNA polymerase **D-** two helicases and two DNA polymerases

50-Avery and his colleagues' experiments found that the cells.....unable to convert R cells into S cells.

- A-** missing DNA **B-** containing DNA **C-** missing protein **D-** missing RNA

Note: choose the correct answer:

(2 marks for each right answer)

1-Both natural killer cells and inhibitory T cells

A- are white blood cells.

C- carry antigens of pathogen on their surfaces

B- play a part in humoral immune response.

D- both (A and C) are correct

2-In this blood transfusion process $AB^+ \rightarrow O^-$:-

(1- anti-Rh antibodies will react with Rh antigens ,2- anti-A antibodies will react with A antigens, 3- anti-B antibodies will react with B antigens)

A- 1 , 2

B- 1 , 2 , 3,

C- 1 , 3

D- 2 , 3

3-The similarity between the mechanism of action of amino acid-based hormones and the mechanism of action of thyroid hormones is that both mechanisms need to: -

A- target cell

B- second messenger

C- bind to its own receptor

D- both (A and C) are correct

4-Uterus contains target cells for which of the following hormones?

A- estrogen

B- progesterone

C- oxytocin

D- all of them are correct

5-When the, in the blood the sensors in the brain send a message to the respiratory muscles to return to a slower breathing rate.

A- carbon dioxide concentration decreases

B- carbon dioxide concentration increases

C- the oxygen and carbon dioxide concentration increase

D- the oxygen concentration decreases

6-All of the following are correct about chemical receptors, **EXCEPT**:

A- are neurons that detect stimuli

B- are clustered in taste buds

C- are found in the mucous lining of the epithelium in the nasal passages

D-the action potentials they produce are interpreted only in the parietal lobe of the cerebral cortex

7-In phase II of HIV infection, all of the following occur **EXCEPT**:-

A- the virus continues to replicate.

B- helper T cells can no longer stimulate B cells.

C- B cells continue to make a large amount of antibody against HIV

D- The number of helper T cells drops steadily

8-The smooth muscle differs from the skeletal muscle in that the smooth muscle: -

A- has origin and insertion points

B- is striated

C- forms the walls of the internal organs

D- is voluntary

9-Which of the following pairs are correctly matched? A- macrophages : display antigens on its surface

B- complement system proteins : are released by cells infected with virus

C- stomach acids : are specific defenses D- thymus : helps produce all kinds of lymphocytes.

10-Tobacco: -

A- contains no substance that causes addiction

B- causes chronic bronchitis

C- burning of it produces tars that paralyzes the cilia that line the respiratory tracts D- both (B and C) are correct

11-Which of the following is **incorrect**?

(1- Only artery carries oxygenated blood, 2- The artery and the vein both have an inner layer of endothelial tissue, 3- The artery divides into smaller blood vessels until they end in capillaries, 4- Only vein carries deoxygenated blood).

A- 1, 3, 4

B- 1, 4

C- 1, 2, 4

D- 2, 3, 4

12- The adjacent figure shows which of the following?

A- a Haversian canal that is surrounded by lamellae in compact bone.

B- a spongy bone that has a latticework structure.

C- a periosteum that contains a network of blood vessels.

D- a long bone cavity that contains the yellow bone marrow.

13-Which of the following is **incorrect** for a relaxed muscle?

A- the length of the actin and the myosin filaments does not change in comparison to a contracted muscle

B- the actin and myosin filaments overlap

C- the actin and myosin filaments slide past each other

D- all of them are incorrect.

14-In the primary and secondary immune responses: -

A- memory cells are produced

B- antibodies are produced

C- antigens are attacked

D- all of them are correct

15-The cardiovascular system differs from the lymphatic system in that the cardiovascular system:

A- is a part of the circulatory system

B- contains red blood cells

C- its vessels are one-way that transport the fluid it contains from the tissues to the heart

D- contains lymphocytes

16-Which of the following is correct regarding the Schwann cell?

A- transmits nerve impulses from the cell body towards the nerve endings

B- produces the myelin around the axon of neurons that are not found in the brain or in the spinal cord

C- receives stimuli from other neurons and transmits them towards the nerve endings

D- produces the myelin around the axon of all neurons

17-In the process of hearing which of the following releases neurotransmitters?

A- the hair cells

B- the fluid inside the cochlea

C- the membrane that covers the hair cells

D- the bottom membrane of the middle chamber

18-What is the role of the follicle-stimulating hormone in humans?

A- along with testosterone, stimulates sperm production

B- stimulates the secretion of testosterone

C- stimulates cell division in a follicle

D- both (A and C) are correct

19-Which of the following is a function of the long bone:

A- its ability to contract and relax enables the body to move

C- helps the body to maintain a constant temperature

B- produces platelets

D- all of them are correct

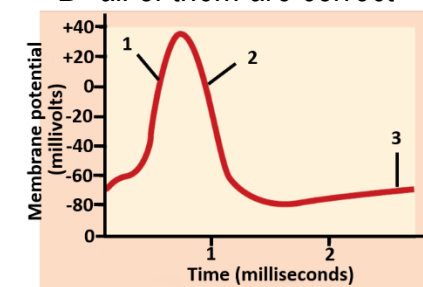

20- Which point on the graph represents when the voltage-gated sodium channels are open?

A- only 1

B- 1 and 3

C- only 3

D- 2 and 3

21-In the axial skeleton, the red bone marrow is found in the:-

A- scapula

B- clavicle

C- sternum

D- both (B and C) are correct

22-Opportunistic infections: -

A- can be considered as evidence that the HIV infection has progressed to AIDS

B- the organisms of these diseases usually do not create problems in people with a healthy immune system

C- appear in phase I of HIV infection

D- both (A and B) are correct

23-Which of the following are the characteristics of the atrioventricular node?

(1- It is located in the septum between the two ventricles, 2- it relays the electrical impulse to the muscle cells that make up the ventricles, 3- it regulates the rate of contraction of the entire heart, 4- it initiates an electrical impulse and causes a QRS wave in the electrocardiograph(ECG))

A- 1, 3, 4

B- 2, 4

C- 1, 2, 4

D- 2, 3, 4

24-Which of the following is correct regarding the cerebellum?

A- it lies below and before the cerebral hemispheres

B- the surface of cerebellum is highly folded

C- It receives motor impulses coming from the ears

D- all of them are correct

25-Which structures of the adjacent figure are **NOT** within the path taken

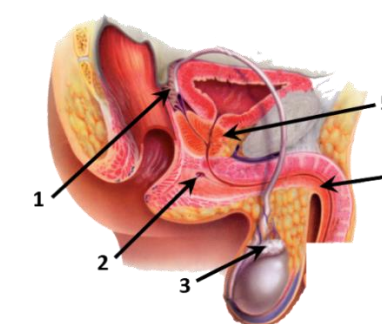

by the sperm as they leave the body?

A- 2, 3, 5

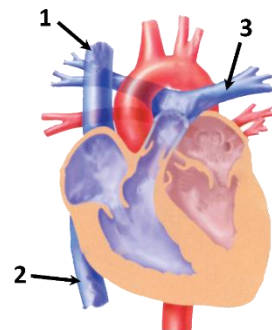

B- 2, 3, 4

C- 1, 2, 5

D- 1, 2, 4

- 26-** Which of the following does **NOT** occur during the first trimester of pregnancy?
A- the legs, eyes, and ears have begun to develop **B-** the fetus can react to loud sounds.
C- fingers are formed. **D-** the heart begins to beat.
- 27-** The male reproductive system structure that lies between the bladder and the rectum, produces a fluid: -
A- rich in sugars **B-** that neutralizes the acids in the female reproductive system
C- that neutralizes traces of acidic urine in the urethra **D-** all of them are incorrect
- 28-** Which of the following is correct about red blood cells?
A- immature red blood cells synthesize large amounts of hemoglobin
B- their cell nucleus and organelles disintegrate **C-** they form antibodies **D-** both (A and B) are correct
- 29-** How many different genotypes can result from a dihybrid cross between two pea plants? If you know that one plant is a heterozygous of both traits and the other is unknown genotype, and that the ratio of heterozygous individuals for the two traits resulting from this cross is 25%.
A- 2 **B-** 4 **C-** 8 **D-** all of them are incorrect

30- Depending on the adjacent figure, all blood vessels

that are labeled by numbers 1, 2, 3: -

- A-** are veins
B- carry deoxygenated blood to the heart
C- their walls are made up of three layers
D- both (A and C) are correct
- 31-** Which of the following is correct regarding the Langerhans Islands?
A- secrete two amino acid-based hormones that lower the blood sugar level
B- contain mostly exocrine cells **C-** function as an endocrine gland. **D-** all of them are correct

32- In skeletal muscle the tissue that bounds together a group of fascicles is a(an): -

- A-** epithelial tissues **B-** nervous tissue **C-** muscle tissue **D-** connective tissue

33- Which of the following directs most incoming sensory signals to the proper region of the cerebral cortex:

- A-** midbrain **B-** medulla oblongata **C-** pons **D-** thalamus

34- During inspiration, the diaphragm....., causing the air pressure inside the lungsthan the air pressure outside the body: -

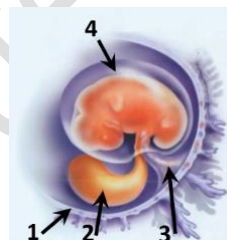

- A-** flattens, lower **B-** contracts, higher
C- relaxes, lower **D-** flattens, higher

35- Which of the following often results in addiction?

- A-** tolerance **B-** withdrawal **C-** dependence **D-** effective dose

36- In the adjacent figure, which number points to the membrane that surrounds all of the other embryonic membranes ?

- A-** 1
B- 2
C- 3
D- 4

37- Epiphyseal plate is **NOT** found at the ends of immature: -.

- A-** fibula bone **B-** skull bones **C-** humerus bone **D-** tibia bone

38- Plasma cells: - **A-** secrete antibodies **B-** create holes in the membranes of the infected cells
C- make antibodies **D-** both (A and C) are correct

39- One of the following is secreted by a ductal gland:-

- A-** aldosterone **B-** human chorionic gonadotropin **C-** cortisol **D-** lysozyme

40- In which of the following states of the monohybrid crosses, 50% of the resulting individuals are recessive?

- A-** If both parents are homozygous and dominant
B- If one of the parents is recessive and the other is heterozygous
C- If one of the parents is homozygous and dominant and the other is heterozygous
D- If both parents are heterozygous

41- In which of the following crosses the ratio of genotype and the ratio of phenotype of the resulting individuals are equal?

- A-** the cross between two heterozygous individuals in incomplete dominance
B- monohybrid cross between two heterozygous individuals in complete dominance
C- dihybrid cross between two homozygous individuals for both characteristics in complete dominance
D- both (A and C) are correct

42- Based on the adjacent table, that shows the ratio of nitrogen bases in humans, virus X, and wheat, which of the following choices is correct:

	Adenine(A)	Thymine(T)	Guanine(G)	Cytosine(C)
Human	30.4	30.1	19.6	19.9
X virus	34.2	25.8	13.8	26.2
Wheat	27.3	27.1	22.7	22.8

- A-** DNA in X virus is single-stranded DNA
B- DNA in human, X virus, and wheat are in the form of a double helix. .
C- the ratio of purines to pyrimidines in human, X virus and wheat is 1:1.
D- all of them are correct

43- Considering the three components of a nucleotide, how many nucleotides are identical (which have the exact same structure) in both DNA and RNA?

- A-** zero **B-** 2 **C-** 3 **D-** 4

44- In each replication fork there are:-

- A-** two helicases and one DNA polymerase **B-** one helicase and two DNA polymerases
C- one helicase and one DNA polymerase **D-** two helicases and two DNA polymerases

45- Which of the following is **INCORRECT**?

- A-** the codon AUG specifies the amino acid methionine in genetic code.
B- the number of anti-codons is 61 anti-codons.
C- the number of codons that specify amino acids is 61 codons
D- the codon GCU, which specifies the amino acid alanine in genetic code, can specify another different amino acid

46- Which of the following represents the sequence that was used to transcribed this sequence

(CUC AAG UGC UUC) of mRNA?

- A-** CUCAAGUGCUUC **B-** GAGUUCACGAAG **C-** GAGTTCACGAAG **D-** AGACCTGTAGGA

47- If the probability that a specific trait will appear in a generation is ($\frac{3}{16}$) and the number of individuals for this trait is (300) individuals, what is the total number of individuals in this generation?

- A-** 300 individuals **B-** 800 individuals **C-** 1600 individuals **D-** 2400 individuals

48- In the process of DNA replication: -

- A-** the number of purines in one of the new strands is equal to the number of pyrimidines in the other new strand
B- the number of pyrimidines in one of the new strands is equal to the number of pyrimidines in the other new strand
C- each original strand serves as a template to make an identical strand as itself **D-** both (A and C) are correct

49- Avery and his colleagues' experiments found that the cells.....unable to convert R cells into S cells.

- A-** missing DNA **B-** containing DNA **C-** missing protein **D-** missing RNA

50- In complete dominance the trait of smooth seeds appears when its genotype is....., but the trait of the terminal flower appears when its genotype is.....

- A-** only homozygous, only heterozygous **B-** only heterozygous, only homozygous
C- homozygous or heterozygous, only homozygous **D-** only heterozygous, homozygous or heterozygous

Note: choose the correct answer: (2 marks for each right answer)

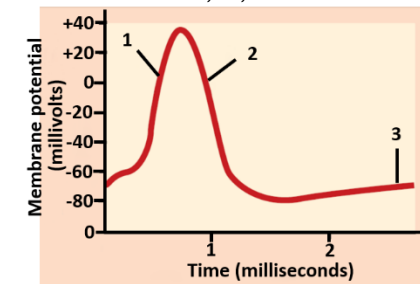

- 1-In this blood transfusion process $AB^+ \longrightarrow O^-$:-
(1- anti-Rh antibodies will react with Rh antigens ,2- anti-A antibodies will react with A antigens, 3- anti-B antibodies will react with B antigens)
A- 1 , 2 B- 1 , 2 , 3, C- 1 , 3 D- 2 , 3
- 2-In the axial skeleton, the red bone marrow is found in the:-
A- scapula B- clavicle C- sternum D- both (B and C) are correct
- 3-Which of the following does **NOT** occur during the first trimester of pregnancy?
A- the legs, eyes, and ears have begun to develop B- the fetus can react to loud sounds.
C- fingers are formed. D- the heart begins to beat.
- 4-Epiphyseal plate is **NOT** found at the ends of immature: -
A- fibula bone B- skull bones C- humerus bone D- tibia bone
- 5-In phase II of HIV infection, all of the following occur **EXCEPT**: -
A- the virus continues to replicate. B- helper T cells can no longer stimulate B cells.
C- B cells continue to make a large amount of antibody against HIV
D- The number of helper T cells drops steadily
- 6-The smooth muscle differs from the skeletal muscle in that the smooth muscle: -
A- has origin and insertion points B- is striated C- forms the walls of the internal organs D- is voluntary
- 7-During inspiration, the diaphragm....., causing the air pressure inside the lungsthan the air pressure outside the body: -
A- flattens, lower B- contracts, higher
C- relaxes, lower D- flattens, higher
- 8-Plasma cells: -
A- secrete antibodies B- create holes in the membranes of the infected cells
C- make antibodies D- both (A and C) are correct
- 9-All of the following are correct about chemical receptors, **EXCEPT**:
A- are neurons that detect stimuli B- are clustered in taste buds
C- are found in the mucous lining of the epithelium in the nasal passages
D-the action potentials they produce are interpreted only in the parietal lobe of the cerebral cortex
- 10-Both natural killer cells and inhibitory T cells
A- are white blood cells. B- play a part in humoral immune response.
C- carry antigens of pathogen on their surfaces D- both (A and C) are correct
- 11-One of the following is secreted by a ductal gland:-
A- aldosterone B- human chorionic gonadotropin C- cortisol D- lysozyme
- 12-The cardiovascular system differs from the lymphatic system in that the cardiovascular system:
A- is a part of the circulatory system B- contains red blood cells
C- its vessels are one-way that transport the fluid it contains from the tissues to the heart
D- contains lymphocytes
- 13-In the primary and secondary immune responses: -
A- memory cells are produced B- antibodies are produced
C- antigens are attacked D- all of them are correct
- 14-Which of the following is **incorrect**?
(1- Only artery carries oxygenated blood, 2- The artery and the vein both have an inner layer of endothelial tissue, 3- The artery divides into smaller blood vessels until they end in capillaries, 4- Only vein carries deoxygenated blood).
A- 1, 3, 4 B- 1, 4 C- 1, 2, 4 D- 2, 3, 4
- 15-Which of the following directs most incoming sensory signals to the proper region of the cerebral cortex:
A- midbrain B- medulla oblongata C- pons D- thalamus

- 16-Which of the following is correct regarding the Schwann cell?
A- transmits nerve impulses from the cell body towards the nerve endings
B- produces the myelin around the axon of neurons that are not found in the brain or in the spinal cord
C- receives stimuli from other neurons and transmits them towards the nerve endings
D- produces the myelin around the axon of all neurons

- 17-Which of the following often results in addiction?
A- tolerance B- withdrawal C- dependence D- effective dose
- 18-Which of the following pairs are correctly matched? A- macrophages : display antigens on its surface
B- complement system proteins : are released by cells infected with virus
C- stomach acids : are specific defenses D- thymus : helps produce all kinds of lymphocytes.
- 19-Which of the following is correct regarding the cerebellum?
A- it lies below and before the cerebral hemispheres B- the surface of cerebellum is highly folded
C- It receives motor impulses coming from the ears D- all of them are correct

- 20-Which of the following are the characteristics of the atrioventricular node?
(1- It is located in the septum between the two ventricles, 2- it relays the electrical impulse to the muscle cells that make up the ventricles, 3- it regulates the rate of contraction of the entire heart, 4- it initiates an electrical impulse and causes a QRS wave in the electrocardiograph(ECG))
A- 1, 3, 4 B- 2, 4 C- 1, 2, 4 D- 2, 3, 4

- 21- Which point on the graph represents when the voltage-gated sodium channels are open?
A- only 1
B- 1 and 3
C- only 3
D- 2 and 3

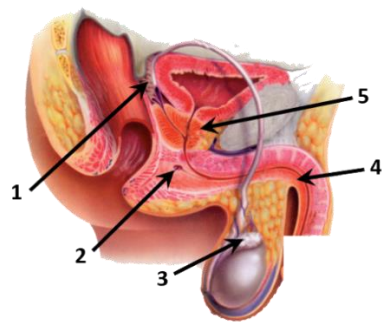

- 22-Which of the following is a function of the long bone:
A- its ability to contract and relax enables the body to move B- produces platelets
C- helps the body to maintain a constant temperature D- all of them are correct
- 23-In skeletal muscle the tissue that bounds together a group of fascicles is a(an): -
A- epithelial tissues B- nervous tissue C- muscle tissue D- connective tissue
- 24-In the process of hearing which of the following releases neurotransmitters?
A- the hair cells B- the fluid inside the cochlea
C- the membrane that covers the hair cells D- the bottom membrane of the middle chamber
- 25-Which of the following is correct about red blood cells?
A- immature red blood cells synthesize large amounts of hemoglobin
B- their cell nucleus and organelles disintegrate C- they form antibodies D- both (A and B) are correct

- 26- The adjacent figure shows which of the following?
A- a Haversian canal that is surrounded by lamellae in compact bone.
B- a spongy bone that has a latticework structure.
C- a periosteum that contains a network of blood vessels.
D- a long bone cavity that contains the yellow bone marrow.

- 27-Which of the following is correct regarding the Langerhans Islands?
A- secrete two amino acid-based hormones that lower the blood sugar level
B- contain mostly exocrine cells C- function as an endocrine gland. D- all of them are correct
- 28-When the, in the blood the sensors in the brain send a message to the respiratory muscles to return to a slower breathing rate.
A- carbon dioxide concentration decreases B- carbon dioxide concentration increases
C- the oxygen and carbon dioxide concentration increase D- the oxygen concentration decreases

29-Which structures of the adjacent figure are **NOT** within the path taken by the sperm as they leave the body?

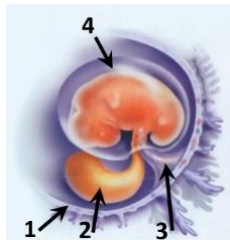

- A- 2, 3, 5
- B- 2, 3, 4
- C- 1, 2, 5
- D- 1, 2, 4

30-The male reproductive system structure that lies between the bladder and the rectum, produces a fluid: -
A- rich in sugars B- that neutralizes the acids in the female reproductive system
C- that neutralizes traces of acidic urine in the urethra D- all of them are incorrect

31-Uterus contains target cells for which of the following hormones?
A- estrogen B- progesterone C- oxytocin D- all of them are correct

32- In the adjacent figure, which number points to the membrane that surrounds all of the other embryonic membranes ?

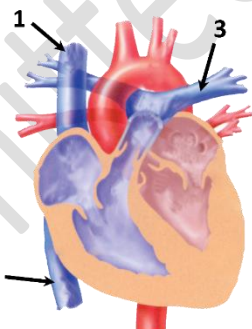

- A- 1
 - B- 2
 - C- 3
 - D- 4
- 33-How many different genotypes can result from a dihybrid cross between two pea plants? If you know that one plant is a heterozygous of both traits and the other is unknown genotype, and that the ratio of heterozygous individuals for the two traits resulting from this cross is 25%.
A- 2 B- 4 C- 8 D- all of them are incorrect

34-Which of the following is **incorrect** for a relaxed muscle?
A- the length of the actin and the myosin filaments does not change in comparison to a contracted muscle
B- the actin and myosin filaments overlap C- the actin and myosin filaments slide past each other
D- all of them are incorrect.

35-Tobacco: -
A- contains no substance that causes addiction B- causes chronic bronchitis
C- burning of it produces tars that paralyzes the cilia that line the respiratory tracts D- both (B and C) are correct

36-What is the role of the follicle-stimulating hormone in humans?
A- along with testosterone, stimulates sperm production B- stimulates the secretion of testosterone
C- stimulates cell division in a follicle D- both (A and C) are correct

37-Depending on the adjacent figure, all blood vessels that are labeled by numbers 1, 2, 3: -

- A- are veins
- B- carry deoxygenated blood to the heart
- C- their walls are made up of three layers
- D- both (A and C) are correct

38-The similarity between the mechanism of action of amino acid-based hormones and the mechanism of action of thyroid hormones is that both mechanisms need to: -
A- target cell B- second messenger C- bind to its own receptor D- both (A and C) are correct

39-Opportunistic infections: -
A- can be considered as evidence that the HIV infection has progressed to AIDS
B- the organisms of these diseases usually do not create problems in people with a healthy immune system
C- appear in phase I of HIV infection D- both (A and B) are correct

40-In which of the following states of the monohybrid crosses ,50% of the resulting individuals are recessive?
A- If both parents are homozygous and dominant
B- If one of the parents is recessive and the other is heterozygous
C- If one of the parents is homozygous and dominant and the other is heterozygous
D- If both parents are heterozygous

41-Which of the following represents the sequence that was used to transcribed this sequence (CUC AAG UGC UUC) of mRNA?
A- CUCAAGUGCUUC B- GAGUUCACGAAG C- GAGTTCACGAAG D- AGACCTGTAGGA

42-In complete dominance the trait of smooth seeds appears when its genotype is.....,but the trait of the terminal flower appears when its genotype is.....
A- only homozygous, only heterozygous B- only heterozygous, only homozygous
C- homozygous or heterozygous, only homozygous D- only heterozygous, homozygous or heterozygous

43- In the process of DNA replication: -
A-the number of purines in one of the new strands is equal to the number of pyrimidines in the other new strand
B-the number of pyrimidines in one of the new strands is equal to the number of pyrimidines in the other new strand
C-each original strand serves as a template to make an identical strand as itself D- both (A and C) are correct

44-Considering the three components of a nucleotide, how many nucleotides are identical (which have the exact same structure) in both DNA and RNA?
A- zero B- 2 C- 3 D- 4

45-Avery and his colleagues' experiments found that the cells.....unable to convert R cells into S cells.
A- missing DNA B- containing DNA C- missing protein D- missing RNA

46-If the probability that a specific trait will appear in a generation is ($\frac{3}{16}$) and the number of individuals for this trait is (300) individuals, what is the total number of individuals in this generation?
A- 300 individuals B- 800 individuals C- 1600 individuals D- 2400 individuals

47-Based on the adjacent table, that shows the ratio of nitrogen bases in humans, virus X, and wheat, which of the following choices is correct:

	Adenine(A)	Thymine(T)	Guanine(G)	Cytosine(C)
Human	30.4	30.1	19.6	19.9
X virus	34.2	25.8	13.8	26.2
Wheat	27.3	27.1	22.7	22.8

- A- DNA in X virus is single-stranded DNA
- B- DNA in human, X virus, and wheat are in the form of a double helix. .
- C- the ratio of purines to pyrimidines in human, X virus and wheat is 1:1.
- D- all of them are correct

48-Which of the following is **INCORRECT**?
A- the codon AUG specifies the amino acid methionine in genetic code.
B- the number of anti-codons is 61 anti-codons.
C- the number of codons that specify amino acids is 61 codons
D- the codon GCU, which specifies the amino acid alanine in genetic code, can specify another different amino acid

49-In which of the following crosses the ratio of genotype and the ratio of phenotype of the resulting individuals are equal?
A- the cross between two heterozygous individuals in incomplete dominance
B- monohybrid cross between two heterozygous individuals in complete dominance
C- dihybrid cross between two homozygous individuals for both characteristics in complete dominance
D- both (A and C) are correct

50-In each replication fork there are:-
A- two helicases and one DNA polymerase B- one helicase and two DNA polymerases
C- one helicase and one DNA polymerase D- two helicases and two DNA polymerases

Note: choose the correct answer: (2 marks for each right answer)

- 1-Which of the following is correct about red blood cells?
A- immature red blood cells synthesize large amounts of hemoglobin
B- their cell nucleus and organelles disintegrate C- they form antibodies D- both (A and B) are correct

- 2-Which of the following are the characteristics of the atrioventricular node?
(1- It is located in the septum between the two ventricles, 2- it relays the electrical impulse to the muscle cells that make up the ventricles, 3- it regulates the rate of contraction of the entire heart, 4- it initiates an electrical impulse and causes a QRS wave in the electrocardiograph(ECG))
A- 1, 3, 4 B- 2, 4 C- 1, 2, 4 D- 2, 3, 4

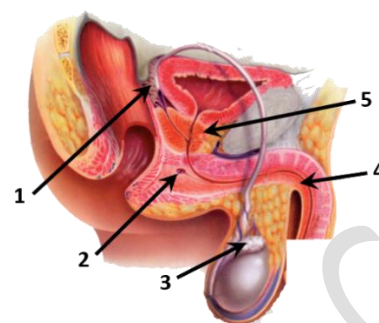

- 3-In skeletal muscle the tissue that bounds together a group of fascicles is a(an): -
A- epithelial tissues B- nervous tissue C- muscle tissue D- connective tissue

- 4-Opportunistic infections: -
A- can be considered as evidence that the HIV infection has progressed to AIDS
B- the organisms of these diseases usually do not create problems in people with a healthy immune system
C- appear in phase I of HIV infection D- both (A and B) are correct

- 5-Which structures of the adjacent figure are **NOT** within the path taken

by the sperm as they leave the body?

- A- 2, 3, 5
B- 2, 3, 4
C- 1, 2, 5
D- 1, 2, 4

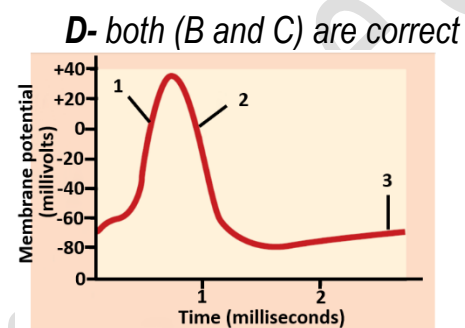

- 6-During inspiration, the diaphragm....., causing the air pressure inside the lungsthan the air pressure outside the body: -
A- flattens, lower B- contracts, higher
C- relaxes, lower D- flattens, higher

- 7-In the axial skeleton, the red bone marrow is found in the:-
A- scapula B- clavicle C- sternum

- 8- Which point on the graph represents when the voltage-gated sodium channels are open?

- A- only 1
B- 1 and 3
C- only 3
D- 2 and 3

- 9-What is the role of the follicle-stimulating hormone in humans?
A- along with testosterone, stimulates sperm production B- stimulates the secretion of testosterone
C- stimulates cell division in a follicle D- both (A and C) are correct

- 10-Both natural killer cells and inhibitory T cells
A- are white blood cells. B- play a part in humoral immune response.
C- carry antigens of pathogen on their surfaces D- both (A and C) are correct

- 11-In phase II of HIV infection, all of the following occur **EXCEPT**: -
A- the virus continues to replicate. B- helper T cells can no longer stimulate B cells.
C- B cells continue to make a large amount of antibody against HIV
D- The number of helper T cells drops steadily

- 12-In this blood transfusion process $AB^+ \longrightarrow O^-$:-
(1- anti-Rh antibodies will react with Rh antigens ,2- anti-A antibodies will react with A antigens, 3- anti-B antibodies will react with B antigens)

- A- 1, 2 B- 1, 2, 3, C- 1, 3 D-.2, 3

- 13-Which of the following is a function of the long bone:
A- its ability to contract and relax enables the body to move B- produces platelets
C- helps the body to maintain a constant temperature D- all of them are correct

- 14-Tobacco: -
A- contains no substance that causes addiction B- causes chronic bronchitis
C- burning of it produces tars that paralyzes the cilia that line the respiratory tracts D- both (B and C) are correct

- 15-The smooth muscle differs from the skeletal muscle in that the smooth muscle: -
A- has origin and insertion points B- is striated C- forms the walls of the internal organs D- is voluntary

- 16-All of the following are correct about chemical receptors, **EXCEPT**:
A- are neurons that detect stimuli B- are clustered in taste buds
C- are found in the mucous lining of the epithelium in the nasal passages
D-the action potentials they produce are interpreted only in the parietal lobe of the cerebral cortex

- 17-The similarity between the mechanism of action of amino acid-based hormones and the mechanism of action of thyroid hormones is that both mechanisms need to: -
A- target cell B- second messenger C- bind to its own receptor D- both (A and C) are correct

- 18-Which of the following is **incorrect**?
(1- Only artery carries oxygenated blood, 2- The artery and the vein both have an inner layer of endothelial tissue, 3- The artery divides into smaller blood vessels until they end in capillaries, 4- Only vein carries deoxygenated blood).
A- 1, 3, 4 B- 1, 4 C- 1, 2, 4 D-.2, 3, 4

- 19-In the primary and secondary immune responses: -
A- memory cells are produced B- antibodies are produced
C- antigens are attacked D- all of them are correct

- 20-Which of the following is correct regarding the Schwann cell?
A- transmits nerve impulses from the cell body towards the nerve endings
B- produces the myelin around the axon of neurons that are not found in the brain or in the spinal cord
C- receives stimuli from other neurons and transmits them towards the nerve endings
D- produces the myelin around the axon of all neurons

- 21-Epiphyseal plate is **NOT** found at the ends of immature: -
A- fibula bone B- skull bones C- humerus bone D- tibia bone

- 22-Which of the following is correct regarding the Langerhans Islands?
A- secrete two amino acid-based hormones that lower the blood sugar level
B- contain mostly exocrine cells C- function as an endocrine gland. D- all of them are correct

- 23-When the, in the blood the sensors in the brain send a message to the respiratory muscles to return to a slower breathing rate.
A- carbon dioxide concentration decreases B- carbon dioxide concentration increases
C- the oxygen and carbon dioxide concentration increase D- the oxygen concentration decreases

- 24-Which of the following is correct regarding the cerebellum?
A- it lies below and before the cerebral hemispheres B- the surface of cerebellum is highly folded
C- It receives motor impulses coming from the ears D- all of them are correct

- 25-The male reproductive system structure that lies between the bladder and the rectum, produces a fluid: -
A- rich in sugars B- that neutralizes the acids in the female reproductive system
C- that neutralizes traces of acidic urine in the urethra D- all of them are incorrect

- 26-Which of the following directs most incoming sensory signals to the proper region of the cerebral cortex:
A- midbrain B- medulla oblongata C- pons D- thalamus

27- The adjacent figure shows which of the following?

- A- a Haversian canal that is surrounded by lamellae in compact bone.
- B- a spongy bone that has a latticework structure.
- C- a periosteum that contains a network of blood vessels.
- D- a long bone cavity that contains the yellow bone marrow.

28-The cardiovascular system differs from the lymphatic system in that the cardiovascular system:

- A- is a part of the circulatory system
- B- contains red blood cells
- C- its vessels are one-way that transport the fluid it contains from the tissues to the heart
- D- contains lymphocytes

29-In the process of hearing which of the following releases neurotransmitters?

- A- the hair cells
- B- the fluid inside the cochlea
- C- the membrane that covers the hair cells
- D- the bottom membrane of the middle chamber

30-Which of the following does **NOT** occur during the first trimester of pregnancy?

- A- the legs, eyes, and ears have begun to develop
- B- the fetus can react to loud sounds.
- C- fingers are formed.
- D- the heart begins to beat.

31-Which of the following pairs are correctly matched? A- macrophages : display antigens on its surface

- B- complement system proteins : are released by cells infected with virus
- C- stomach acids : are specific defenses
- D- thymus : helps produce all kinds of lymphocytes.

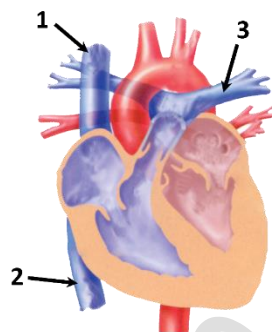

32-Which of the following is **incorrect** for a relaxed muscle?

- A- the length of the actin and the myosin filaments does not change in comparison to a contracted muscle
- B- the actin and myosin filaments overlap
- C- the actin and myosin filaments slide past each other
- D- all of them are incorrect.

33-Depending on the adjacent figure, all blood vessels

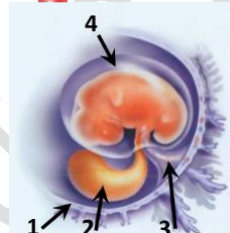

that are labeled by numbers 1, 2, 3: -

- A- are veins
- B- carry deoxygenated blood to the heart
- C- their walls are made up of three layers
- D- both (A and C) are correct

34- In the adjacent figure, which number points to the membrane that surrounds all of the other embryonic membranes ?

- A- 1
- B- 2
- C- 3
- D- 4

35-Plasma cells: - A- secrete antibodies B- create holes in the membranes of the infected cells

- C- make antibodies
- D- both (A and C) are correct

36-One of the following is secreted by a ductal gland:-

- A- aldosterone
- B- human chorionic gonadotropin
- C- cortisol
- D- lysozyme

37-How many different genotypes can result from a dihybrid cross between two pea plants? If you know that one plant is a heterozygous of both traits and the other is unknown genotype, and that the ratio of heterozygous individuals for the two traits resulting from this cross is 25%.

- A- 2
- B- 4
- C- 8
- D- all of them are incorrect

38-Uterus contains target cells for which of the following hormones?

- A- estrogen
- B- progesterone
- C- oxytocin
- D- all of them are correct

39-Which of the following often results in addiction?

- A- tolerance
- B- withdrawal
- C- dependence
- D- effective dose

40-In which of the following states of the monohybrid crosses ,50% of the resulting individuals are recessive?

- A- If both parents are homozygous and dominant
- B- If one of the parents is recessive and the other is heterozygous
- C- If one of the parents is homozygous and dominant and the other is heterozygous
- D- If both parents are heterozygous

41-Considering the three components of a nucleotide, how many nucleotides are identical (which have the exact same structure) in both DNA and RNA?

- A- zero
- B- 2
- C- 3
- D- 4

42-In which of the following crosses the ratio of genotype and the ratio of phenotype of the resulting individuals are equal?

- A- the cross between two heterozygous individuals in incomplete dominance
- B- monohybrid cross between two heterozygous individuals in complete dominance
- C- dihybrid cross between two homozygous individuals for both characteristics in complete dominance
- D- both (A and C) are correct

43-In each replication fork there are:-

- A- two helicases and one DNA polymerase
- B- one helicase and two DNA polymerases
- C- one helicase and one DNA polymerase
- D- two helicases and two DNA polymerases

44-In complete dominance the trait of smooth seeds appears when its genotype is.....,but the trait of the terminal flower appears when its genotype is.....

- A- only homozygous, only heterozygous
- B- only heterozygous, only homozygous
- C- homozygous or heterozygous, only homozygous
- D- only heterozygous, homozygous or heterozygous

45-Based on the adjacent table, that shows the ratio of nitrogen bases in humans, virus X, and wheat, which of the following choices is correct:

	Adenine(A)	Thymine(T)	Guanine(G)	Cytosine(C)
Human	30.4	30.1	19.6	19.9
X virus	34.2	25.8	13.8	26.2
Wheat	27.3	27.1	22.7	22.8

- A- DNA in X virus is single-stranded DNA
- B- DNA in human, X virus, and wheat are in the form of a double helix. .
- C- the ratio of purines to pyrimidines in human, X virus and wheat is 1:1.
- D- all of them are correct

46-If the probability that a specific trait will appear in a generation is ($\frac{3}{16}$) and the number of individuals for this trait is (300) individuals, what is the total number of individuals in this generation?

- A- 300 individuals
- B- 800 individuals
- C- 1600 individuals
- D- 2400 individuals

47-Which of the following is **INCORRECT**?

- A- the codon AUG specifies the amino acid methionine in genetic code.
- B- the number of anti-codons is 61 anti-codons.
- C- the number of codons that specify amino acids is 61 codons
- D- the codon GCU, which specifies the amino acid alanine in genetic code, can specify another different amino acid

48-Which of the following represents the sequence that was used to transcribed this sequence (CUC AAG UGC UUC) of mRNA?

- A- CUCAAGUGCUUC
- B- GAGUUCACGAAG
- C- GAGTTCACGAAG
- D- AGACCTGTAGGA

49- In the process of DNA replication: -

- A-the number of purines in one of the new strands is equal to the number of pyrimidines in the other new strand
- B-the number of pyrimidines in one of the new strands is equal to the number of pyrimidines in the other new strand
- C-each original strand serves as a template to make an identical strand as itself
- D- both (A and C) are correct

50-Avery and his colleagues' experiments found that the cells.....unable to convert R cells into S cells.

- A- missing DNA
- B- containing DNA
- C- missing protein
- D- missing RNA

Note: choose the correct answer:

(2 marks for each right answer)

1-Which of the following is correct about red blood cells?

- A- immature red blood cells synthesize large amounts of hemoglobin
B- their cell nucleus and organelles disintegrate C- they form antibodies D- both (A and B) are correct

2-The similarity between the mechanism of action of amino acid-based hormones and the mechanism of action of thyroid hormones is that both mechanisms need to: -

- A- target cell B- second messenger C- bind to its own receptor D- both (A and C) are correct

3-Plasma cells: - A- secrete antibodies B- create holes in the membranes of the infected cells
C- make antibodies D- both (A and C) are correct

4-Both natural killer cells and inhibitory T cells

- A- are white blood cells. B- play a part in humoral immune response.
C- carry antigens of pathogen on their surfaces D- both (A and C) are correct

5-Which of the following is correct regarding the Langerhans Islands?

- A- secrete two amino acid-based hormones that lower the blood sugar level
B- contain mostly exocrine cells C- function as an endocrine gland. D- all of them are correct

6-The cardiovascular system differs from the lymphatic system in that the cardiovascular system:

- A- is a part of the circulatory system B- contains red blood cells
C- its vessels are one-way that transport the fluid it contains from the tissues to the heart
D- contains lymphocytes

7-During inspiration, the diaphragm....., causing the air pressure inside the lungsthan the air pressure outside the body: -

- A- flattens, lower B- contracts, higher
C- relaxes, lower D- flattens, higher

8-Which of the following is correct regarding the Schwann cell?

- A- transmits nerve impulses from the cell body towards the nerve endings
B- produces the myelin around the axon of neurons that are not found in the brain or in the spinal cord
C- receives stimuli from other neurons and transmits them towards the nerve endings
D- produces the myelin around the axon of all neurons

9-How many different genotypes can result from a dihybrid cross between two pea plants? If you know that one plant is a heterozygous of both traits and the other is unknown genotype, and that the ratio of heterozygous individuals for the two traits resulting from this cross is 25%.

- A- 2 B- 4 C- 8 D- all of them are incorrect

10-The male reproductive system structure that lies between the bladder and the rectum, produces a fluid: -

- A- rich in sugars B- that neutralizes the acids in the female reproductive system
C- that neutralizes traces of acidic urine in the urethra D- all of them are incorrect

11-Which of the following is **incorrect** for a relaxed muscle?

- A- the length of the actin and the myosin filaments does not change in comparison to a contracted muscle
B- the actin and myosin filaments overlap C- the actin and myosin filaments slide past each other
D- all of them are incorrect.

12-Which of the following often results in addiction?

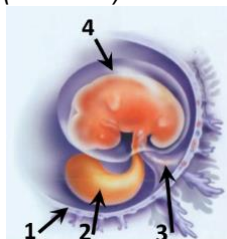

- A- tolerance B- withdrawal C- dependence D- effective dose

13-Tobacco: -

- A- contains no substance that causes addiction B- causes chronic bronchitis
C- burning of it produces tars that paralyzes the cilia that line the respiratory tracts D- both (B and C) are correct

14- In the adjacent figure, which number points to the membrane that surrounds all of the other embryonic membranes ?

- A- 1
B- 2
C- 3
D- 4

15-When the, in the blood the sensors in the brain send a message to the respiratory muscles to return to a slower breathing rate.

- A- carbon dioxide concentration decreases B- carbon dioxide concentration increases
C- the oxygen and carbon dioxide concentration increase D- the oxygen concentration decreases

16-In this blood transfusion process $AB^+ \longrightarrow O^-$:-

(1- anti-Rh antibodies will react with Rh antigens ,2- anti-A antibodies will react with A antigens, 3- anti-B antibodies will react with B antigens)

- A- 1 , 2 B- 1 , 2 , 3, C- 1 , 3 D-.2 , 3

17-Opportunistic infections: -

- A- can be considered as evidence that the HIV infection has progressed to AIDS
B- the organisms of these diseases usually do not create problems in people with a healthy immune system
C- appear in phase I of HIV infection D- both (A and B) are correct

18-Which of the following does **NOT** occur during the first trimester of pregnancy?

- A- the legs, eyes, and ears have begun to develop B- the fetus can react to loud sounds.
C- fingers are formed. D- the heart begins to beat.

19-In the primary and secondary immune responses: -

- A- memory cells are produced B- antibodies are produced
C- antigens are attacked D- all of them are correct

20-Which of the following is correct regarding the cerebellum?

- A- it lies below and before the cerebral hemispheres B- the surface of cerebellum is highly folded
C- It receives motor impulses coming from the ears D- all of them are correct

21-One of the following is secreted by a ductal gland:-

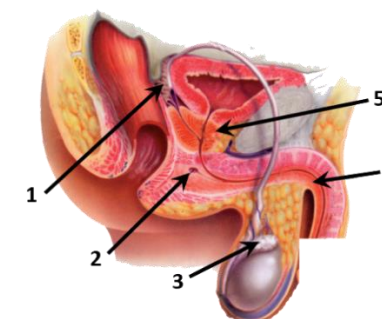

- A- aldosterone B- human chorionic gonadotropin C- cortisol D- lysozyme

22-In phase II of HIV infection, all of the following occur **EXCEPT**: -

- A- the virus continues to replicate. B- helper T cells can no longer stimulate B cells.
C- B cells continue to make a large amount of antibody against HIV
D- The number of helper T cells drops steadily

23-Which structures of the adjacent figure are **NOT** within the path taken by the sperm as they leave the body?

- A- 2, 3, 5
B- 2, 3, 4
C- 1, 2, 5
D- 1, 2, 4

24-Which of the following directs most incoming sensory signals to the proper region of the cerebral cortex:

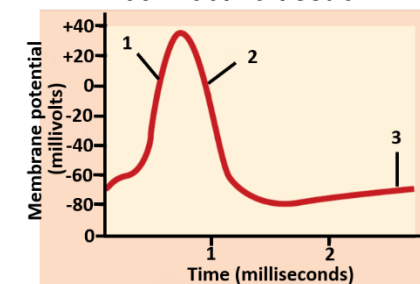

- A- midbrain B- medulla oblongata C- pons D- thalamus

25-In skeletal muscle the tissue that bounds together a group of fascicles is a(an): -

- A- epithelial tissues B- nervous tissue C- muscle tissue D- connective tissue

26- Which point on the graph represents when the voltage-gated sodium channels are open?

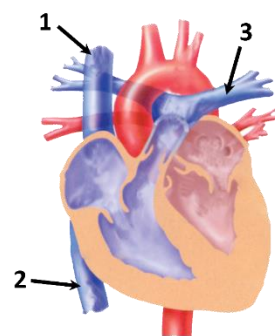

- A- only 1
B- 1 and 3
C- only 3
D- 2 and 3

27-Depending on the adjacent figure, all blood vessels

that are labeled by numbers 1, 2, 3: -

- A- are veins
- B- carry deoxygenated blood to the heart
- C- their walls are made up of three layers
- D- both (A and C) are correct

28-In the process of hearing which of the following releases neurotransmitters?

- A- the hair cells
- B- the fluid inside the cochlea
- C- the membrane that covers the hair cells
- D- the bottom membrane of the middle chamber

29-Which of the following pairs are correctly matched? A- macrophages : display antigens on its surface

- B- complement system proteins : are released by cells infected with virus
- C- stomach acids : are specific defenses
- D- thymus : helps produce all kinds of lymphocytes.

30-The smooth muscle differs from the skeletal muscle in that the smooth muscle: -

- A- has origin and insertion points
- B- is striated
- C- forms the walls of the internal organs
- D- is voluntary

31-Which of the following is a function of the long bone:

- A- its ability to contract and relax enables the body to move
- B- produces platelets
- C- helps the body to maintain a constant temperature
- D- all of them are correct

32-Epiphyseal plate is **NOT** found at the ends of immature: -.

- A- fibula bone
- B- skull bones
- C- humerus bone
- D- tibia bone

33-In the axial skeleton, the red bone marrow is found in the:-

- A- scapula
- B- clavicle
- C- sternum
- D- both (B and C) are correct

34-Uterus contains target cells for which of the following hormones?

- A- estrogen
- B- progesterone
- C- oxytocin
- D- all of them are correct

35-Which of the following is **incorrect**?

(1- Only artery carries oxygenated blood, 2- The artery and the vein both have an inner layer of endothelial tissue, 3- The artery divides into smaller blood vessels until they end in capillaries, 4- Only vein carries deoxygenated blood).

- A- 1, 3, 4
- B- 1, 4
- C- 1, 2, 4
- D- 2, 3, 4

36- The adjacent figure shows which of the following?

- A- a Haversian canal that is surrounded by lamellae in compact bone.
- B- a spongy bone that has a latticework structure.
- C- a periosteum that contains a network of blood vessels.
- D- a long bone cavity that contains the yellow bone marrow.

37-All of the following are correct about chemical receptors, **EXCEPT**:

- A- are neurons that detect stimuli
- B- are clustered in taste buds
- C- are found in the mucous lining of the epithelium in the nasal passages
- D- the action potentials they produce are interpreted only in the parietal lobe of the cerebral cortex

38-What is the role of the follicle-stimulating hormone in humans?

- A- along with testosterone, stimulates sperm production
- B- stimulates the secretion of testosterone
- C- stimulates cell division in a follicle
- D- both (A and C) are correct

39-Which of the following are the characteristics of the atrioventricular node?

(1- It is located in the septum between the two ventricles, 2- it relays the electrical impulse to the muscle cells that make up the ventricles, 3- it regulates the rate of contraction of the entire heart, 4- it initiates an electrical impulse and causes a QRS wave in the electrocardiograph(ECG))

- A- 1, 3, 4
- B- 2, 4
- C- 1, 2, 4
- D- 2, 3, 4

40-In which of the following states of the monohybrid crosses ,50% of the resulting individuals are recessive?

- A- If both parents are homozygous and dominant
- B- If one of the parents is recessive and the other is heterozygous
- C- If one of the parents is homozygous and dominant and the other is heterozygous
- D- If both parents are heterozygous

41-Which of the following represents the sequence that was used to transcribed this sequence

(CUC AAG UGC UUC) of mRNA?

- A- CUCAAGUGCUUC
- B- GAGUUCACGAAG
- C- GAGTTCACGAAG
- D- AGACCTGTAGGA

42-In complete dominance the trait of smooth seeds appears when its genotype is.....,but the trait of the terminal flower appears when its genotype is.....

- A- only homozygous, only heterozygous
- B- only heterozygous, only homozygous
- C- homozygous or heterozygous, only homozygous
- D- only heterozygous, homozygous or heterozygous

43-Based on the adjacent table, that shows the ratio

of nitrogen bases in humans, virus X, and wheat,

which of the following choices is correct:

- A- DNA in X virus is single-stranded DNA
- B- DNA in human, X virus, and wheat are in the form of a double helix. .
- C- the ratio of purines to pyrimidines in human, X virus and wheat is 1:1.
- D- all of them are correct

	Adenine(A)	Thymine(T)	Guanine(G)	Cytosine(C)
Human	30.4	30.1	19.6	19.9
X virus	34.2	25.8	13.8	26.2
Wheat	27.3	27.1	22.7	22.8

44-If the probability that a specific trait will appear in a generation is ($\frac{3}{16}$) and the number of individuals for this trait is (300) individuals, what is the total number of individuals in this generation?

- A- 300 individuals
- B- 800 individuals
- C- 1600 individuals
- D- 2400 individuals

45- In the process of DNA replication: -

- A- the number of purines in one of the new strands is equal to the number of pyrimidines in the other new strand
- B- the number of pyrimidines in one of the new strands is equal to the number of pyrimidines in the other new strand
- C- each original strand serves as a template to make an identical strand as itself
- D- both (A and C) are correct

46-Considering the three components of a nucleotide, how many nucleotides are identical (which have the exact same structure) in both DNA and RNA?

- A- zero
- B- 2
- C- 3
- D- 4

47-In which of the following crosses the ratio of genotype and the ratio of phenotype of the resulting individuals are equal?

- A- the cross between two heterozygous individuals in incomplete dominance
- B- monohybrid cross between two heterozygous individuals in complete dominance
- C- dihybrid cross between two homozygous individuals for both characteristics in complete dominance
- D- both (A and C) are correct

48-Avery and his colleagues' experiments found that the cells.....unable to convert R cells into S cells.

- A- missing DNA
- B- containing DNA
- C- missing protein
- D- missing RNA

49-In each replication fork there are:-

- A- two helicases and one DNA polymerase
- B- one helicase and two DNA polymerases
- C- one helicase and one DNA polymerase
- D- two helicases and two DNA polymerases

50-Which of the following is **INCORRECT**?

- A- the codon AUG specifies the amino acid methionine in genetic code.
- B- the number of anti-codons is 61 anti-codons.
- C- the number of codons that specify amino acids is 61 codons
- D- the codon GCU, which specifies the amino acid alanine in genetic code, can specify another different amino acid

Note: choose the correct answer:

(2 marks for each right answer)

1-In phase II of HIV infection, all of the following occur **EXCEPT**: -

- A- the virus continues to replicate. B- helper T cells can no longer stimulate B cells.
C- B cells continue to make a large amount of antibody against HIV
D- The number of helper T cells drops steadily

2-One of the following is secreted by a ductal gland:-

- A- aldosterone B- human chorionic gonadotropin C- cortisol D- lysozyme

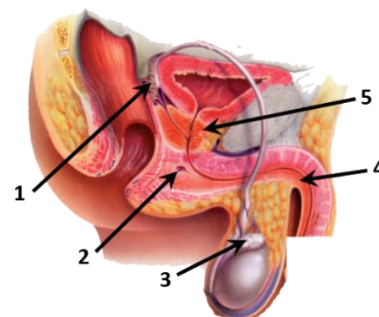

3-When the, in the blood the sensors in the brain send a message to the respiratory muscles to return to a slower breathing rate.

- A- carbon dioxide concentration decreases B- carbon dioxide concentration increases
C- the oxygen and carbon dioxide concentration increase D- the oxygen concentration decreases

4-Which structures of the adjacent figure are **NOT** within the path taken

by the sperm as they leave the body?

- A- 2, 3, 5
B- 2, 3, 4
C- 1, 2, 5
D- 1, 2, 4

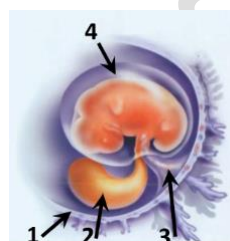

5-Opportunistic infections: -

- A- can be considered as evidence that the HIV infection has progressed to AIDS
B- the organisms of these diseases usually do not create problems in people with a healthy immune system
C- appear in phase I of HIV infection D- both (A and B) are correct

6- In the adjacent figure, which number points to the membrane that surrounds all of the other embryonic membranes ?

- A- 1
B- 2
C- 3
D- 4

7-Both natural killer cells and inhibitory T cells

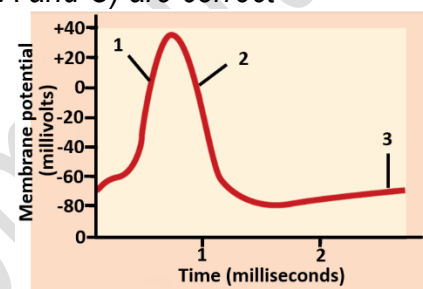

- A- are white blood cells.
C- carry antigens of pathogen on their surfaces

B- play a part in humoral immune response.

D- both (A and C) are correct

8- Which point on the graph represents when the voltage-gated sodium channels are open?

- A- only 1
B- 1 and 3
C- only 3
D- 2 and 3

9-Which of the following is correct regarding the Langerhans Islands?

- A- secrete two amino acid-based hormones that lower the blood sugar level
B- contain mostly exocrine cells C- function as an endocrine gland. D- all of them are correct

10-The cardiovascular system differs from the lymphatic system in that the cardiovascular system:

- A- is a part of the circulatory system B- contains red blood cells
C- its vessels are one-way that transport the fluid it contains from the tissues to the heart
D- contains lymphocytes

11-In the axial skeleton, the red bone marrow is found in the:-

- A- scapula B- clavicle C- sternum D- both (B and C) are correct

12-The smooth muscle differs from the skeletal muscle in that the smooth muscle: -

- A- has origin and insertion points B- is striated C- forms the walls of the internal organs D- is voluntary

13-Epiphyseal plate is **NOT** found at the ends of immature: -

- A- fibula bone B- skull bones C- humerus bone D- tibia bone

14-Plasma cells: -

- A- secrete antibodies B- create holes in the membranes of the infected cells
C- make antibodies D- both (A and C) are correct

15-Which of the following does **NOT** occur during the first trimester of pregnancy?

- A- the legs, eyes, and ears have begun to develop B- the fetus can react to loud sounds.
C- fingers are formed. D- the heart begins to beat.

16-Which of the following is correct about red blood cells?

- A- immature red blood cells synthesize large amounts of hemoglobin
B- their cell nucleus and organelles disintegrate C- they form antibodies D- both (A and B) are correct

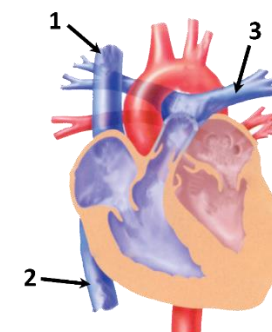

17-In skeletal muscle the tissue that bounds together a group of fascicles is a(an): -

- A- epithelial tissues B- nervous tissue C- muscle tissue D- connective tissue

18-Depending on the adjacent figure, all blood vessels

that are labeled by numbers 1, 2, 3: -

- A- are veins
B- carry deoxygenated blood to the heart
C- their walls are made up of three layers
D- both (A and C) are correct

19-Uterus contains target cells for which of the following hormones?

- A- estrogen B- progesterone C- oxytocin D- all of them are correct

20-Which of the following is a function of the long bone:

- A- its ability to contract and relax enables the body to move B- produces platelets
C- helps the body to maintain a constant temperature D- all of them are correct

21-Which of the following directs most incoming sensory signals to the proper region of the cerebral cortex:

- A- midbrain B- medulla oblongata C- pons D- thalamus

22-Which of the following are the characteristics of the atrioventricular node?

- (1- It is located in the septum between the two ventricles, 2- it relays the electrical impulse to the muscle cells that make up the ventricles, 3- it regulates the rate of contraction of the entire heart, 4- it initiates an electrical impulse and causes a QRS wave in the electrocardiograph(ECG))
A- 1, 3, 4 B- 2, 4 C- 1, 2, 4 D- 2, 3, 4

23-Which of the following is correct regarding the cerebellum?

- A- it lies below and before the cerebral hemispheres B- the surface of cerebellum is highly folded
C- It receives motor impulses coming from the ears D- all of them are correct

24-The male reproductive system structure that lies between the bladder and the rectum, produces a fluid: -

- A- rich in sugars B- that neutralizes the acids in the female reproductive system
C- that neutralizes traces of acidic urine in the urethra D- all of them are incorrect

25-Which of the following pairs are correctly matched? A- macrophages : display antigens on its surface

- B- complement system proteins : are released by cells infected with virus
C- stomach acids : are specific defenses D- thymus : helps produce all kinds of lymphocytes.

26-Which of the following is correct regarding the Schwann cell?

- A- transmits nerve impulses from the cell body towards the nerve endings
B- produces the myelin around the axon of neurons that are not found in the brain or in the spinal cord
C- receives stimuli from other neurons and transmits them towards the nerve endings
D- produces the myelin around the axon of all neurons

27-Which of the following often results in addiction?

- A- tolerance B- withdrawal C- dependence D- effective dose

28-How many different genotypes can result from a dihybrid cross between two pea plants? If you know that one plant is a heterozygous of both traits and the other is unknown genotype, and that the ratio of heterozygous individuals for the two traits resulting from this cross is 25%.

- A- 2 B- 4 C- 8 D- all of them are incorrect

29-Tobacco: -

- A- contains no substance that causes addiction B- causes chronic bronchitis
C- burning of it produces tars that paralyzes the cilia that line the respiratory tracts D- both (B and C) are correct

30-Which of the following is **incorrect** for a relaxed muscle?

- A- the length of the actin and the myosin filaments does not change in comparison to a contracted muscle
B- the actin and myosin filaments overlap C- the actin and myosin filaments slide past each other
D- all of them are incorrect.

31-What is the role of the follicle-stimulating hormone in humans?

- A- along with testosterone, stimulates sperm production B- stimulates the secretion of testosterone
C- stimulates cell division in a follicle D- both (A and C) are correct

32-Which of the following is **incorrect**?

(1- Only artery carries oxygenated blood, 2- The artery and the vein both have an inner layer of endothelial tissue, 3- The artery divides into smaller blood vessels until they end in capillaries, 4- Only vein carries deoxygenated blood).

- A- 1, 3, 4 B- 1, 4 C- 1, 2, 4 D- 2, 3, 4

33-All of the following are correct about chemical receptors, **EXCEPT**:

- A- are neurons that detect stimuli B- are clustered in taste buds
C- are found in the mucous lining of the epithelium in the nasal passages
D- the action potentials they produce are interpreted only in the parietal lobe of the cerebral cortex

34-The similarity between the mechanism of action of amino acid-based hormones and the mechanism of action of thyroid hormones is that both mechanisms need to: -

- A- target cell B- second messenger C- bind to its own receptor D- both (A and C) are correct

35-In the process of hearing which of the following releases neurotransmitters?

- A- the hair cells B- the fluid inside the cochlea
C- the membrane that covers the hair cells D- the bottom membrane of the middle chamber

36- The adjacent figure shows which of the following?

- A- a Haversian canal that is surrounded by lamellae in compact bone.
B- a spongy bone that has a latticework structure.
C- a periosteum that contains a network of blood vessels.
D- a long bone cavity that contains the yellow bone marrow.

37-During inspiration, the diaphragm....., causing the air pressure inside the lungsthan the air pressure outside the body: -

- A- flattens, lower B- contracts, higher
C- relaxes, lower D- flattens, higher

38-In this blood transfusion process $AB^+ \longrightarrow O^-$:-

(1- anti-Rh antibodies will react with Rh antigens ,2- anti-A antibodies will react with A antigens, 3- anti-B antibodies will react with B antigens)

- A- 1, 2 B- 1, 2, 3, C- 1, 3 D- 2, 3

39-In the primary and secondary immune responses: -

- A- memory cells are produced B- antibodies are produced
C- antigens are attacked D- all of them are correct

40-In which of the following states of the monohybrid crosses ,50% of the resulting individuals are recessive?

- A- If both parents are homozygous and dominant
B- If one of the parents is recessive and the other is heterozygous
C- If one of the parents is homozygous and dominant and the other is heterozygous
D- If both parents are heterozygous

41-If the probability that a specific trait will appear in a generation is ($\frac{3}{16}$) and the number of individuals for this trait is (300) individuals, what is the total number of individuals in this generation?

- A- 300 individuals B- 800 individuals C- 1600 individuals D- 2400 individuals

42-In each replication fork there are:-

- A- two helicases and one DNA polymerase
C- one helicase and one DNA polymerase

- B- one helicase and two DNA polymerases
D- two helicases and two DNA polymerases

43-Based on the adjacent table, that shows the ratio of nitrogen bases in humans, virus X, and wheat, which of the following choices is correct:

	Adenine(A)	Thymine(T)	Guanine(G)	Cytosine(C)
Human	30.4	30.1	19.6	19.9
X virus	34.2	25.8	13.8	26.2
Wheat	27.3	27.1	22.7	22.8

- A- DNA in X virus is single-stranded DNA
B- DNA in human, X virus, and wheat are in the form of a double helix. .
C- the ratio of purines to pyrimidines in human, X virus and wheat is 1:1.
D- all of them are correct

44-Which of the following represents the sequence that was used to transcribed this sequence (CUC AAG UGC UUC) of mRNA?

- A- CUCAAGUGCUUC B- GAGUUCACGAAG C- GAGTTCACGAAG D- AGACCTGTAGGA

45-Avery and his colleagues' experiments found that the cells.....unable to convert R cells into S cells.

- A- missing DNA B- containing DNA C- missing protein D- missing RNA

46-Considering the three components of a nucleotide, how many nucleotides are identical (which have the exact same structure) in both DNA and RNA?

- A- zero B- 2 C- 3 D- 4

47- In the process of DNA replication: -

- A- the number of purines in one of the new strands is equal to the number of pyrimidines in the other new strand
B- the number of pyrimidines in one of the new strands is equal to the number of pyrimidines in the other new strand
C- each original strand serves as a template to make an identical strand as itself D- both (A and C) are correct

48-In complete dominance the trait of smooth seeds appears when its genotype is.....,but the trait of the terminal flower appears when its genotype is.....

- A- only homozygous, only heterozygous B- only heterozygous, only homozygous
C- homozygous or heterozygous, only homozygous D- only heterozygous, homozygous or heterozygous

49-In which of the following crosses the ratio of genotype and the ratio of phenotype of the resulting individuals are equal?

- A- the cross between two heterozygous individuals in incomplete dominance
B- monohybrid cross between two heterozygous individuals in complete dominance
C- dihybrid cross between two homozygous individuals for both characteristics in complete dominance
D- both (A and C) are correct

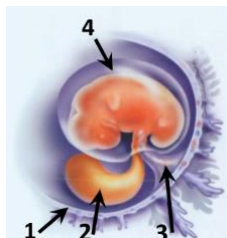

50-Which of the following is **INCORRECT**?

- A- the codon AUG specifies the amino acid methionine in genetic code.
B- the number of anti-codons is 61 anti-codons.
C- the number of codons that specify amino acids is 61 codons
D- the codon GCU, which specifies the amino acid alanine in genetic code, can specify another different amino acid

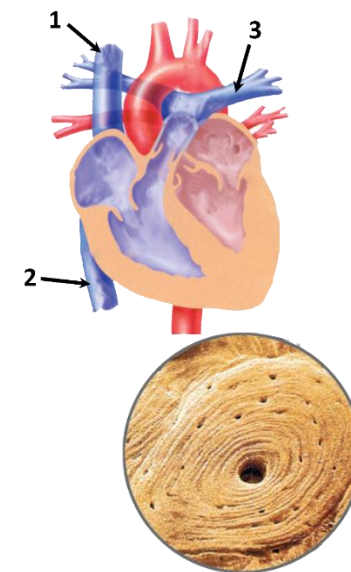

Note: choose the correct answer: (2 marks for each right answer)

- 1-Which of the following is correct regarding the Langerhans Islands?
A- secrete two amino acid-based hormones that lower the blood sugar level
B- contain mostly exocrine cells C- function as an endocrine gland. D- all of them are correct
- 2-In phase II of HIV infection, all of the following occur **EXCEPT**: -
A- the virus continues to replicate. B- helper T cells can no longer stimulate B cells.
C- B cells continue to make a large amount of antibody against HIV
D- The number of helper T cells drops steadily
- 3-When the, in the blood the sensors in the brain send a message to the respiratory muscles to return to a slower breathing rate.
A- carbon dioxide concentration decreases B- carbon dioxide concentration increases
C- the oxygen and carbon dioxide concentration increase D- the oxygen concentration decreases
- 4-Plasma cells: - A- secrete antibodies B- create holes in the membranes of the infected cells
C- make antibodies D- both (A and C) are correct
- 5-The similarity between the mechanism of action of amino acid-based hormones and the mechanism of action of thyroid hormones is that both mechanisms need to: -
A- target cell B- second messenger C- bind to its own receptor D- both (A and C) are correct
- 6-Which of the following directs most incoming sensory signals to the proper region of the cerebral cortex:
A- midbrain B- medulla oblongata C- pons D- thalamus
- 7- In the adjacent figure, which number points to the membrane that surrounds all of the other embryonic membranes ?
A- 1
B- 2
C- 3
D- 4
- 8-Which of the following is correct about red blood cells?
A- immature red blood cells synthesize large amounts of hemoglobin
B- their cell nucleus and organelles disintegrate C- they form antibodies D- both (A and B) are correct
- 9-Which of the following is correct regarding the cerebellum?
A- it lies below and before the cerebral hemispheres B- the surface of cerebellum is highly folded
C- It receives motor impulses coming from the ears D- all of them are correct
- 10-What is the role of the follicle-stimulating hormone in humans?
A- along with testosterone, stimulates sperm production B- stimulates the secretion of testosterone
C- stimulates cell division in a follicle D- both (A and C) are correct
- 11-Which of the following often results in addiction?
A- tolerance B- withdrawal C- dependence D- effective dose
- 12-During inspiration, the diaphragm....., causing the air pressure inside the lungsthan the air pressure outside the body: -
A- flattens, lower B- contracts, higher
C- relaxes, lower D- flattens, higher
- 13-The smooth muscle differs from the skeletal muscle in that the smooth muscle: -
A- has origin and insertion points B- is striated C- forms the walls of the internal organs D- is voluntary
- 14-Tobacco: -
A- contains no substance that causes addiction B- causes chronic bronchitis
C- burning of it produces tars that paralyzes the cilia that line the respiratory tracts D- both (B and C) are correct
- 15-In the axial skeleton, the red bone marrow is found in the:-
A- scapula B- clavicle C- sternum D- both (B and C) are correct

- 16-Which of the following pairs are correctly matched? A- macrophages : display antigens on its surface
B- complement system proteins : are released by cells infected with virus
C- stomach acids : are specific defenses D- thymus : helps produce all kinds of lymphocytes.
- 17-Both natural killer cells and inhibitory T cells
A- are white blood cells. B- play a part in humoral immune response.
C- carry antigens of pathogen on their surfaces D- both (A and C) are correct
- 18-Depending on the adjacent figure, all blood vessels that are labeled by numbers 1, 2, 3: -
A- are veins
B- carry deoxygenated blood to the heart
C- their walls are made up of three layers
D- both (A and C) are correct
- 19- The adjacent figure shows which of the following?
A- a Haversian canal that is surrounded by lamellae in compact bone.
B- a spongy bone that has a latticework structure.
C- a periosteum that contains a network of blood vessels.
D- a long bone cavity that contains the yellow bone marrow.
- 20-All of the following are correct about chemical receptors, **EXCEPT**:
A- are neurons that detect stimuli B- are clustered in taste buds
C- are found in the mucous lining of the epithelium in the nasal passages
D-the action potentials they produce are interpreted only in the parietal lobe of the cerebral cortex
- 21-In the primary and secondary immune responses: -
A- memory cells are produced B- antibodies are produced
C- antigens are attacked D- all of them are correct
- 22-Which of the following is **incorrect** for a relaxed muscle?
A- the length of the actin and the myosin filaments does not change in comparison to a contracted muscle
B- the actin and myosin filaments overlap C- the actin and myosin filaments slide past each other
D- all of them are incorrect.
- 23-The male reproductive system structure that lies between the bladder and the rectum, produces a fluid: -
A- rich in sugars B- that neutralizes the acids in the female reproductive system
C- that neutralizes traces of acidic urine in the urethra D- all of them are incorrect
- 24-In skeletal muscle the tissue that bounds together a group of fascicles is a(an): -
A- epithelial tissues B- nervous tissue C- muscle tissue D- connective tissue
- 25-One of the following is secreted by a ductal gland:-
A- aldosterone B- human chorionic gonadotropin C- cortisol D- lysozyme
- 26-Which of the following are the characteristics of the atrioventricular node?
(1- It is located in the septum between the two ventricles, 2- it relays the electrical impulse to the muscle cells that make up the ventricles, 3- it regulates the rate of contraction of the entire heart, 4- it initiates an electrical impulse and causes a QRS wave in the electrocardiograph(ECG))
A- 1, 3, 4 B- 2, 4 C- 1, 2, 4 D- 2, 3, 4
- 27-The cardiovascular system differs from the lymphatic system in that the cardiovascular system:
A- is a part of the circulatory system B- contains red blood cells
C- its vessels are one-way that transport the fluid it contains from the tissues to the heart
D- contains lymphocytes
- 28-Epiphyseal plate is **NOT** found at the ends of immature: -
A- fibula bone B- skull bones C- humerus bone D- tibia bone
- 29-Which of the following is a function of the long bone:
A- its ability to contract and relax enables the body to move B- produces platelets
C- helps the body to maintain a constant temperature D- all of them are correct

30-How many different genotypes can result from a dihybrid cross between two pea plants? If you know that one plant is a heterozygous of both traits and the other is unknown genotype, and that the ratio of heterozygous individuals for the two traits resulting from this cross is 25%.

- A-** 2 **B-** 4 **C-** 8 **D-** all of them are incorrect

31-Which of the following is **incorrect**?

(1- Only artery carries oxygenated blood, 2- The artery and the vein both have an inner layer of endothelial tissue, 3- The artery divides into smaller blood vessels until they end in capillaries, 4- Only vein carries deoxygenated blood).

- A-** 1, 3, 4 **B-** 1, 4 **C-** 1, 2, 4 **D-** 2, 3, 4

32-Uterus contains target cells for which of the following hormones?

- A-** estrogen **B-** progesterone **C-** oxytocin **D-** all of them are correct

33-Which of the following is correct regarding the Schwann cell?

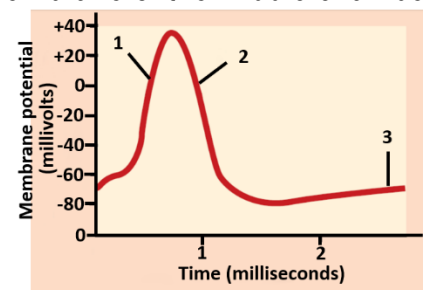

- A-** transmits nerve impulses from the cell body towards the nerve endings
B- produces the myelin around the axon of neurons that are not found in the brain or in the spinal cord
C- receives stimuli from other neurons and transmits them towards the nerve endings
D- produces the myelin around the axon of all neurons

34-In the process of hearing which of the following releases neurotransmitters?

- A-** the hair cells **B-** the fluid inside the cochlea
C- the membrane that covers the hair cells **D-** the bottom membrane of the middle chamber

35- Which point on the graph represents when the voltage-gated sodium channels are open?

- A-** only 1
B- 1 and 3
C- only 3
D- 2 and 3

36-Opportunistic infections: -

- A-** can be considered as evidence that the HIV infection has progressed to AIDS
B- the organisms of these diseases usually do not create problems in people with a healthy immune system
C- appear in phase I of HIV infection **D-** both (A and B) are correct

37-Which of the following does **NOT** occur during the first trimester of pregnancy?

- A-** the legs, eyes, and ears have begun to develop **B-** the fetus can react to loud sounds.
C- fingers are formed. **D-** the heart begins to beat.

38-In this blood transfusion process $AB^+ \longrightarrow O^-$:-

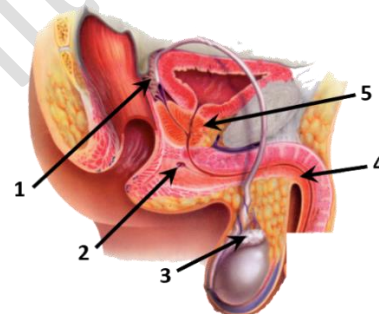

(1- anti-Rh antibodies will react with Rh antigens ,2- anti-A antibodies will react with A antigens, 3- anti-B antibodies will react with B antigens)

- A-** 1, 2 **B-** 1, 2, 3, **C-** 1, 3 **D-** 2, 3

39-Which structures of the adjacent figure are **NOT** within the path taken

by the sperm as they leave the body?

- A-** 2, 3, 5
B- 2, 3, 4
C- 1, 2, 5
D- 1, 2, 4

40-In which of the following states of the monohybrid crosses ,50% of the resulting individuals are recessive?

- A-** If both parents are homozygous and dominant
B- If one of the parents is recessive and the other is heterozygous
C- If one of the parents is homozygous and dominant and the other is heterozygous
D- If both parents are heterozygous

41-In which of the following crosses the ratio of genotype and the ratio of phenotype of the resulting individuals are equal?

- A-** the cross between two heterozygous individuals in incomplete dominance
B- monohybrid cross between two heterozygous individuals in complete dominance
C- dihybrid cross between two homozygous individuals for both characteristics in complete dominance
D- both (A and C) are correct

42- In the process of DNA replication: -

- A-**the number of purines in one of the new strands is equal to the number of pyrimidines in the other new strand
B-the number of pyrimidines in one of the new strands is equal to the number of pyrimidines in the other new strand
C-each original strand serves as a template to make an identical strand as itself **D-** both (A and C) are correct

43-Based on the adjacent table, that shows the ratio of nitrogen bases in humans, virus X, and wheat, which of the following choices is correct:

	Adenine(A)	Thymine(T)	Guanine(G)	Cytosine(C)
Human	30.4	30.1	19.6	19.9
X virus	34.2	25.8	13.8	26.2
Wheat	27.3	27.1	22.7	22.8

- A-** DNA in X virus is single-stranded DNA
B- DNA in human, X virus, and wheat are in the form of a double helix. .
C- the ratio of purines to pyrimidines in human, X virus and wheat is 1:1.
D- all of them are correct

44-Considering the three components of a nucleotide, how many nucleotides are identical (which have the exact same structure) in both DNA and RNA?

- A-** zero **B-** 2 **C-** 3 **D-** 4

45-Which of the following is **INCORRECT**?

- A-** the codon AUG specifies the amino acid methionine in genetic code.
B- the number of anti-codons is 61 anti-codons.
C- the number of codons that specify amino acids is 61 codons
D- the codon GCU, which specifies the amino acid alanine in genetic code, can specify another different amino acid

46-Avery and his colleagues' experiments found that the cells.....unable to convert R cells into S cells.

- A-** missing DNA **B-** containing DNA **C-** missing protein **D-** missing RNA

47-In complete dominance the trait of smooth seeds appears when its genotype is.....,but the trait of the terminal flower appears when its genotype is.....

- A-** only homozygous, only heterozygous **B-** only heterozygous, only homozygous
C- homozygous or heterozygous, only homozygous **D-** only heterozygous, homozygous or heterozygous

48-In each replication fork there are:-

- A-** two helicases and one DNA polymerase **B-** one helicase and two DNA polymerases
C- one helicase and one DNA polymerase **D-** two helicases and two DNA polymerases

49-Which of the following represents the sequence that was used to transcribed this sequence (CUC AAG UGC UUC) of mRNA?

- A-** CUCAAGUGCUUC **B-** GAGUUCACGAAG **C-** GAGTTCACGAAG **D-** AGACCTGTAGGA

50-If the probability that a specific trait will appear in a generation is ($\frac{3}{16}$) and the number of individuals for this trait is (300) individuals, what is the total number of individuals in this generation?

- A-** 300 individuals **B-** 800 individuals **C-** 1600 individuals **D-** 2400 individuals

Note: choose the correct answer:

(2 marks for each right answer)

- 1-Which of the following pairs are correctly matched? **A-** macrophages : display antigens on its surface
B- complement system proteins : are released by cells infected with virus
C- stomach acids : are specific defenses **D-** thymus : helps produce all kinds of lymphocytes.
- 2-Opportunistic infections: -
A- can be considered as evidence that the HIV infection has progressed to AIDS
B- the organisms of these diseases usually do not create problems in people with a healthy immune system
C- appear in phase I of HIV infection **D-** both (A and B) are correct
- 3-What is the role of the follicle-stimulating hormone in humans?
A- along with testosterone, stimulates sperm production **B-** stimulates the secretion of testosterone
C- stimulates cell division in a follicle **D-** both (A and C) are correct
- 4-In the axial skeleton, the red bone marrow is found in the:-
A- scapula **B-** clavicle **C-** sternum **D-** both (B and C) are correct
- 5-Which of the following is correct regarding the Schwann cell?
A- transmits nerve impulses from the cell body towards the nerve endings
B- produces the myelin around the axon of neurons that are not found in the brain or in the spinal cord
C- receives stimuli from other neurons and transmits them towards the nerve endings
D- produces the myelin around the axon of all neurons
- 6-The male reproductive system structure that lies between the bladder and the rectum, produces a fluid: -
A- rich in sugars **B-** that neutralizes the acids in the female reproductive system
C- that neutralizes traces of acidic urine in the urethra **D-** all of them are incorrect
- 7-Which of the following are the characteristics of the atrioventricular node?
(1- It is located in the septum between the two ventricles, 2- it relays the electrical impulse to the muscle cells that make up the ventricles, 3- it regulates the rate of contraction of the entire heart, 4- it initiates an electrical impulse and causes a QRS wave in the electrocardiograph(ECG))
A- 1, 3, 4 **B-** 2, 4 **C-** 1, 2, 4 **D-** 2, 3, 4
- 8-During inspiration, the diaphragm....., causing the air pressure inside the lungsthan the air pressure outside the body: -
A- flattens, lower **B-** contracts, higher
C- relaxes, lower **D-** flattens, higher
- 9-In the process of hearing which of the following releases neurotransmitters?
A- the hair cells **B-** the fluid inside the cochlea
C- the membrane that covers the hair cells **D-** the bottom membrane of the middle chamber
- 10-Which of the following directs most incoming sensory signals to the proper region of the cerebral cortex:
A- midbrain **B-** medulla oblongata **C-** pons **D-** thalamus
- 11-Which of the following is correct regarding the cerebellum?
A- it lies below and before the cerebral hemispheres **B-** the surface of cerebellum is highly folded
C- It receives motor impulses coming from the ears **D-** all of them are correct
- 12-Which of the following is **incorrect**?
(1- Only artery carries oxygenated blood, 2- The artery and the vein both have an inner layer of endothelial tissue, 3- The artery divides into smaller blood vessels until they end in capillaries, 4- Only vein carries deoxygenated blood).
A- 1, 3, 4 **B-** 1, 4 **C-** 1, 2, 4 **D-** 2, 3, 4
- 13-In the primary and secondary immune responses: -
A- memory cells are produced **B-** antibodies are produced
C- antigens are attacked **D-** all of them are correct
- 14-The smooth muscle differs from the skeletal muscle in that the smooth muscle: -
A- has origin and insertion points **B-** is striated **C-** forms the walls of the internal organs **D-** is voluntary
- 15-The similarity between the mechanism of action of amino acid-based hormones and the mechanism of action of thyroid hormones is that both mechanisms need to: -
A- target cell **B-** second messenger **C-** bind to its own receptor **D-** both (A and C) are correct

16-In this blood transfusion process $AB^+ \longrightarrow O^-$:-

(1- anti-Rh antibodies will react with Rh antigens ,2- anti-A antibodies will react with A antigens, 3- anti-B antibodies will react with B antigens)

A- 1, 2

B- 1, 2, 3,

C- 1, 3

D- 2, 3

17-Plasma cells: -

A- secrete antibodies

B- create holes in the membranes of the infected cells

C- make antibodies

D- both (A and C) are correct

18-Which of the following is **incorrect** for a relaxed muscle?

A- the length of the actin and the myosin filaments does not change in comparison to a contracted muscle

B- the actin and myosin filaments overlap

C- the actin and myosin filaments slide past each other

D- all of them are incorrect.

19-When the, in the blood the sensors in the brain send a message to the respiratory muscles to return to a slower breathing rate.

A- carbon dioxide concentration decreases

B- carbon dioxide concentration increases

C- the oxygen and carbon dioxide concentration increase

D- the oxygen concentration decreases

20-Which of the following is correct regarding the Langerhans Islands?

A- secrete two amino acid-based hormones that lower the blood sugar level

B- contain mostly exocrine cells

C- function as an endocrine gland.

D- all of them are correct

21-All of the following are correct about chemical receptors, **EXCEPT**:

A- are neurons that detect stimuli

B- are clustered in taste buds

C- are found in the mucous lining of the epithelium in the nasal passages

D- the action potentials they produce are interpreted only in the parietal lobe of the cerebral cortex

22-Which structures of the adjacent figure are **NOT** within the path taken

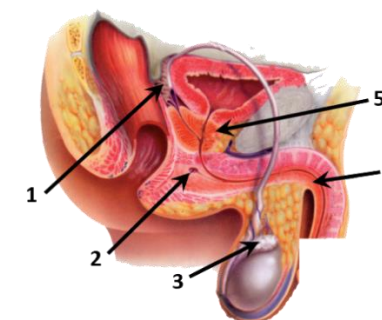

by the sperm as they leave the body?

A- 2, 3, 5

B- 2, 3, 4

C- 1, 2, 5

D- 1, 2, 4

23-The cardiovascular system differs from the lymphatic system in that the cardiovascular system:

A- is a part of the circulatory system

B- contains red blood cells

C- its vessels are one-way that transport the fluid it contains from the tissues to the heart

D- contains lymphocytes

24-Depending on the adjacent figure, all blood vessels

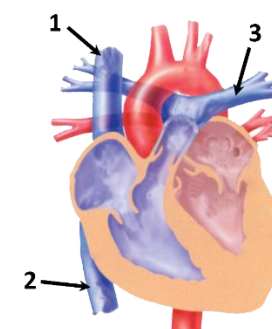

that are labeled by numbers 1, 2, 3: -

A- are veins

B- carry deoxygenated blood to the heart

C- their walls are made up of three layers

D- both (A and C) are correct

25- The adjacent figure shows which of the following?

A- a Haversian canal that is surrounded by lamellae in compact bone.

B- a spongy bone that has a latticework structure.

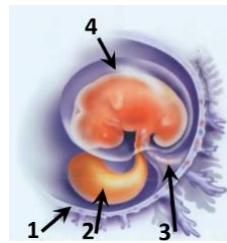

C- a periosteum that contains a network of blood vessels.

D- a long bone cavity that contains the yellow bone marrow.

26- In the adjacent figure, which number points to the membrane that surrounds all of the other embryonic membranes ?

- A- 1
- B- 2
- C- 3
- D- 4

27-Tobacco: -

- A- contains no substance that causes addiction
- B- causes chronic bronchitis
- C- burning of it produces tars that paralyzes the cilia that line the respiratory tracts
- D- both (B and C) are correct

28-Which of the following often results in addiction?

- A- tolerance
- B- withdrawal
- C- dependence
- D- effective dose

29-Epiphyseal plate is **NOT** found at the ends of immature: -

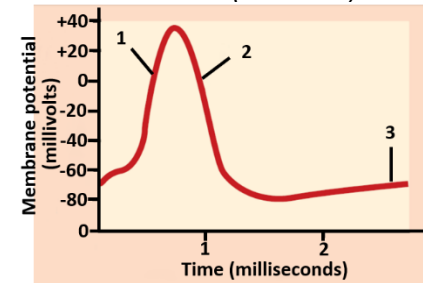

- A- fibula bone
- B- skull bones
- C- humerus bone
- D- tibia bone

30-Which of the following is correct about red blood cells?

- A- immature red blood cells synthesize large amounts of hemoglobin
- B- their cell nucleus and organelles disintegrate
- C- they form antibodies
- D- both (A and B) are correct

31- Which point on the graph represents when the voltage-gated sodium channels are open?

- A- only 1
- B- 1 and 3
- C- only 3
- D- 2 and 3

32-How many different genotypes can result from a dihybrid cross between two pea plants? If you know that one plant is a heterozygous of both traits and the other is unknown genotype, and that the ratio of heterozygous individuals for the two traits resulting from this cross is 25%.

- A- 2
- B- 4
- C- 8
- D- all of them are incorrect

33-Both natural killer cells and inhibitory T cells

- A- are white blood cells.
- B- play a part in humoral immune response.
- C- carry antigens of pathogen on their surfaces
- D- both (A and C) are correct

34-Which of the following does **NOT** occur during the first trimester of pregnancy?

- A- the legs, eyes, and ears have begun to develop
- B- the fetus can react to loud sounds.
- C- fingers are formed.
- D- the heart begins to beat.

35-In phase II of HIV infection, all of the following occur **EXCEPT**: -

- A- the virus continues to replicate.
- B- helper T cells can no longer stimulate B cells.
- C- B cells continue to make a large amount of antibody against HIV
- D- The number of helper T cells drops steadily

36-In skeletal muscle the tissue that bounds together a group of fascicles is a(an): -

- A- epithelial tissues
- B- nervous tissue
- C- muscle tissue
- D- connective tissue

37-Uterus contains target cells for which of the following hormones?

- A- estrogen
- B- progesterone
- C- oxytocin
- D- all of them are correct

38-Which of the following is a function of the long bone:

- A- its ability to contract and relax enables the body to move
- B- produces platelets
- C- helps the body to maintain a constant temperature
- D- all of them are correct

39-One of the following is secreted by a ductal gland:-

- A- aldosterone
- B- human chorionic gonadotropin
- C- cortisol
- D- lysozyme

40-In which of the following states of the monohybrid crosses ,50% of the resulting individuals are recessive?

- A- If both parents are homozygous and dominant
- B- If one of the parents is recessive and the other is heterozygous
- C- If one of the parents is homozygous and dominant and the other is heterozygous
- D- If both parents are heterozygous

41-Which of the following is **INCORRECT**?

- A- the codon AUG specifies the amino acid methionine in genetic code.
- B- the number of anti-codons is 61 anti-codons.
- C- the number of codons that specify amino acids is 61 codons
- D- the codon GCU, which specifies the amino acid alanine in genetic code, can specify another different amino acid

42-Which of the following represents the sequence that was used to transcribed this sequence (CUC AAG UGC UUC) of mRNA?

- A- CUCAAGUGCUUC
- B- GAGUUCACGAAG
- C- GAGTTCACGAAG
- D- AGACCTGTAGGA

43-Avery and his colleagues' experiments found that the cells.....unable to convert R cells into S cells.

- A- missing DNA
- B- containing DNA
- C- missing protein
- D- missing RNA

44-Based on the adjacent table, that shows the ratio of nitrogen bases in humans, virus X, and wheat, which of the following choices is correct:

	Adenine(A)	Thymine(T)	Guanine(G)	Cytosine(C)
Human	30.4	30.1	19.6	19.9
X virus	34.2	25.8	13.8	26.2
Wheat	27.3	27.1	22.7	22.8

- A- DNA in X virus is single-stranded DNA
- B- DNA in human, X virus, and wheat are in the form of a double helix. .
- C- the ratio of purines to pyrimidines in human, X virus and wheat is 1:1.
- D- all of them are correct

45- In the process of DNA replication: -

- A-the number of purines in one of the new strands is equal to the number of pyrimidines in the other new strand
- B-the number of pyrimidines in one of the new strands is equal to the number of pyrimidines in the other new strand
- C-each original strand serves as a template to make an identical strand as itself
- D- both (A and C) are correct

46-In each replication fork there are:-

- A- two helicases and one DNA polymerase
- B- one helicase and two DNA polymerases
- C- one helicase and one DNA polymerase
- D- two helicases and two DNA polymerases

47-Considering the three components of a nucleotide, how many nucleotides are identical (which have the exact same structure) in both DNA and RNA?

- A- zero
- B- 2
- C- 3
- D- 4

48-In which of the following crosses the ratio of genotype and the ratio of phenotype of the resulting individuals are equal?

- A- the cross between two heterozygous individuals in incomplete dominance
- B- monohybrid cross between two heterozygous individuals in complete dominance
- C- dihybrid cross between two homozygous individuals for both characteristics in complete dominance
- D- both (A and C) are correct

49-If the probability that a specific trait will appear in a generation is ($\frac{3}{16}$) and the number of individuals for this trait is (300) individuals, what is the total number of individuals in this generation?

- A- 300 individuals
- B- 800 individuals
- C- 1600 individuals
- D- 2400 individuals

50-In complete dominance the trait of smooth seeds appears when its genotype is.....,but the trait of the terminal flower appears when its genotype is.....

- A- only homozygous, only heterozygous
- B- only heterozygous, only homozygous
- C- homozygous or heterozygous, only homozygous
- D- only heterozygous, homozygous or heterozygous

Note: choose the correct answer:

(2 marks for each right answer)

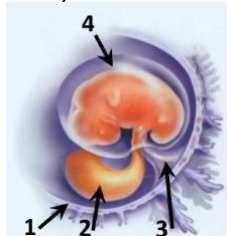

- 1-Tobacco: -
A- contains no substance that causes addiction B- causes chronic bronchitis
C- burning of it produces tars that paralyzes the cilia that line the respiratory tracts D- both (B and C) are correct
- 2-In the axial skeleton, the red bone marrow is found in the:-
A- scapula B- clavicle C- sternum D- both (B and C) are correct
- 3-Plasma cells: -
A- secrete antibodies B- create holes in the membranes of the infected cells
C- make antibodies D- both (A and C) are correct

4-The similarity between the mechanism of action of amino acid-based hormones and the mechanism of action of thyroid hormones is that both mechanisms need to: -

- A- target cell B- second messenger C- bind to its own receptor D- both (A and C) are correct

5- In the adjacent figure, which number points to the membrane that surrounds all of the other embryonic membranes ?

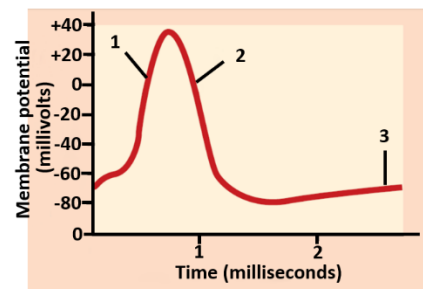

- A- 1
B- 2
C- 3
D- 4

6-Which of the following is a function of the long bone:

- A- its ability to contract and relax enables the body to move
C- helps the body to maintain a constant temperature

- B- produces platelets
D- all of them are correct

7- Which point on the graph represents when the voltage-gated sodium channels are open?

- A- only 1
B- 1 and 3
C- only 3
D- 2 and 3

8-In skeletal muscle the tissue that bounds together a group of fascicles is a(an): -

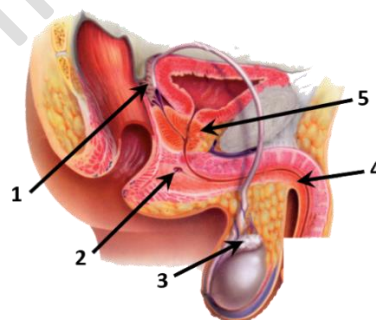

- A- epithelial tissues B- nervous tissue C- muscle tissue D- connective tissue

9-The cardiovascular system differs from the lymphatic system in that the cardiovascular system:

- A- is a part of the circulatory system B- contains red blood cells
C- its vessels are one-way that transport the fluid it contains from the tissues to the heart
D- contains lymphocytes

10-Which structures of the adjacent figure are **NOT** within the path taken by the sperm as they leave the body?

- A- 2, 3, 5
B- 2, 3, 4
C- 1, 2, 5
D- 1, 2, 4

11-All of the following are correct about chemical receptors, **EXCEPT**:

- A- are neurons that detect stimuli B- are clustered in taste buds
C- are found in the mucous lining of the epithelium in the nasal passages
D-the action potentials they produce are interpreted only in the parietal lobe of the cerebral cortex

12-Which of the following often results in addiction?

- A- tolerance B- withdrawal C- dependence D- effective dose

13-What is the role of the follicle-stimulating hormone in humans?

- A- along with testosterone, stimulates sperm production B- stimulates the secretion of testosterone
C- stimulates cell division in a follicle D- both (A and C) are correct

14-In this blood transfusion process $AB^+ \longrightarrow O^-$:-
(1- anti-Rh antibodies will react with Rh antigens ,2- anti-A antibodies will react with A antigens, 3- anti-B antibodies will react with B antigens)

- A- 1 , 2 B- 1 , 2 , 3, C- 1 , 3 D-.2 , 3

15-Which of the following is **incorrect** for a relaxed muscle?

- A- the length of the actin and the myosin filaments does not change in comparison to a contracted muscle
B- the actin and myosin filaments overlap C- the actin and myosin filaments slide past each other
D- all of them are incorrect.

16-In the primary and secondary immune responses: -

- A- memory cells are produced B- antibodies are produced
C- antigens are attacked D- all of them are correct

17-Which of the following are the characteristics of the atrioventricular node?

- (1- It is located in the septum between the two ventricles, 2- it relays the electrical impulse to the muscle cells that make up the ventricles, 3- it regulates the rate of contraction of the entire heart, 4- it initiates an electrical impulse and causes a QRS wave in the electrocardiograph(ECG))

- A- 1, 3, 4 B- 2, 4 C- 1, 2, 4 D- 2, 3, 4

18-Which of the following is correct regarding the Schwann cell?

- A- transmits nerve impulses from the cell body towards the nerve endings
B- produces the myelin around the axon of neurons that are not found in the brain or in the spinal cord
C- receives stimuli from other neurons and transmits them towards the nerve endings
D- produces the myelin around the axon of all neurons

19- The adjacent figure shows which of the following?

- A- a Haversian canal that is surrounded by lamellae in compact bone.
B- a spongy bone that has a latticework structure.
C- a periosteum that contains a network of blood vessels.
D- a long bone cavity that contains the yellow bone marrow.

20-When the, in the blood the sensors in the brain send a message to the respiratory muscles to return to a slower breathing rate.

- A- carbon dioxide concentration decreases B- carbon dioxide concentration increases
C- the oxygen and carbon dioxide concentration increase D- the oxygen concentration decreases

21-Which of the following is correct regarding the cerebellum?

- A- it lies below and before the cerebral hemispheres B- the surface of cerebellum is highly folded
C- It receives motor impulses coming from the ears D- all of them are correct

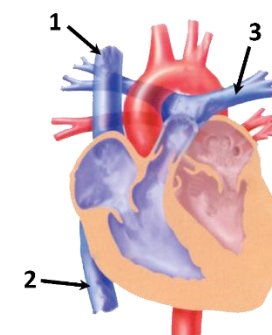

22-Which of the following is correct about red blood cells?

- A- immature red blood cells synthesize large amounts of hemoglobin
B- their cell nucleus and organelles disintegrate C- they form antibodies D- both (A and B) are correct

23-Depending on the adjacent figure, all blood vessels

that are labeled by numbers 1, 2, 3: -

- A- are veins
B- carry deoxygenated blood to the heart
C- their walls are made up of three layers
D- both (A and C) are correct

24-Which of the following is **incorrect**?

- (1- Only artery carries oxygenated blood, 2- The artery and the vein both have an inner layer of endothelial tissue, 3- The artery divides into smaller blood vessels until they end in capillaries, 4- Only vein carries deoxygenated blood).

- A- 1, 3, 4 B- 1, 4 C- 1, 2, 4 D-.2, 3, 4

- 25-**During inspiration, the diaphragm....., causing the air pressure inside the lungsthan the air pressure outside the body: -
A- flattens, lower **B-** contracts, higher
C- relaxes, lower **D-** flattens, higher
- 26-**One of the following is secreted by a ductal gland:-
A- aldosterone **B-** human chorionic gonadotropin **C-** cortisol **D-** lysozyme
- 27-**Which of the following is correct regarding the Langerhans Islands?
A- secrete two amino acid-based hormones that lower the blood sugar level
B- contain mostly exocrine cells **C-** function as an endocrine gland. **D-** all of them are correct
- 28-**The male reproductive system structure that lies between the bladder and the rectum, produces a fluid: -
A- rich in sugars **B-** that neutralizes the acids in the female reproductive system
C- that neutralizes traces of acidic urine in the urethra **D-** all of them are incorrect
- 29-**Which of the following pairs are correctly matched? **A-** macrophages : display antigens on its surface
B- complement system proteins : are released by cells infected with virus
C- stomach acids : are specific defenses **D-** thymus : helps produce all kinds of lymphocytes.
- 30-**Uterus contains target cells for which of the following hormones?
A- estrogen **B-** progesterone **C-** oxytocin **D-** all of them are correct
- 31-**In the process of hearing which of the following releases neurotransmitters?
A- the hair cells **B-** the fluid inside the cochlea
C- the membrane that covers the hair cells **D-** the bottom membrane of the middle chamber
- 32-**Which of the following does **NOT** occur during the first trimester of pregnancy?
A- the legs, eyes, and ears have begun to develop **B-** the fetus can react to loud sounds.
C- fingers are formed. **D-** the heart begins to beat.
- 33-**How many different genotypes can result from a dihybrid cross between two pea plants? If you know that one plant is a heterozygous of both traits and the other is unknown genotype, and that the ratio of heterozygous individuals for the two traits resulting from this cross is 25%.
A- 2 **B-** 4 **C-** 8 **D-** all of them are incorrect
- 34-**In phase II of HIV infection, all of the following occur **EXCEPT**: -
A- the virus continues to replicate. **B-** helper T cells can no longer stimulate B cells.
C- B cells continue to make a large amount of antibody against HIV
D- The number of helper T cells drops steadily
- 35-**Which of the following directs most incoming sensory signals to the proper region of the cerebral cortex:
A- midbrain **B-** medulla oblongata **C-** pons **D-** thalamus
- 36-**Both natural killer cells and inhibitory T cells
A- are white blood cells. **B-** play a part in humoral immune response.
C- carry antigens of pathogen on their surfaces **D-** both (A and C) are correct
- 37-**Epiphyseal plate is **NOT** found at the ends of immature: -.
A- fibula bone **B-** skull bones **C-** humerus bone **D-** tibia bone
- 38-**Opportunistic infections: -
A- can be considered as evidence that the HIV infection has progressed to AIDS
B- the organisms of these diseases usually do not create problems in people with a healthy immune system
C- appear in phase I of HIV infection **D-** both (A and B) are correct
- 39-**The smooth muscle differs from the skeletal muscle in that the smooth muscle: -
A- has origin and insertion points **B-** is striated **C-** forms the walls of the internal organs **D-** is voluntary
- 40-**In which of the following states of the monohybrid crosses ,50% of the resulting individuals are recessive?
A- If both parents are homozygous and dominant
B- If one of the parents is recessive and the other is heterozygous
C- If one of the parents is homozygous and dominant and the other is heterozygous
D- If both parents are heterozygous

- 41-**In which of the following crosses the ratio of genotype and the ratio of phenotype of the resulting individuals are equal?
A- the cross between two heterozygous individuals in incomplete dominance
B- monohybrid cross between two heterozygous individuals in complete dominance
C- dihybrid cross between two homozygous individuals for both characteristics in complete dominance
D- both (A and C) are correct
- 42-**Which of the following is **INCORRECT**?
A- the codon AUG specifies the amino acid methionine in genetic code.
B- the number of anti-codons is 61 anti-codons.
C- the number of codons that specify amino acids is 61 codons
D- the codon GCU, which specifies the amino acid alanine in genetic code, can specify another different amino acid
- 43-**Which of the following represents the sequence that was used to transcribed this sequence (CUC AAG UGC UUC) of mRNA?
A- CUCAAGUGCUUC **B-** GAGUUCACGAAG **C-** GAGTTCACGAAG **D-** AGACCTGTAGGA
- 44-**If the probability that a specific trait will appear in a generation is ($\frac{3}{16}$) and the number of individuals for this trait is (300) individuals, what is the total number of individuals in this generation?
A- 300 individuals **B-** 800 individuals **C-** 1600 individuals **D-** 2400 individuals
- 45-** In the process of DNA replication: -
A-the number of purines in one of the new strands is equal to the number of pyrimidines in the other new strand
B-the number of pyrimidines in one of the new strands is equal to the number of pyrimidines in the other new strand
C-each original strand serves as a template to make an identical strand as itself **D-** both (A and C) are correct
- 46-**Considering the three components of a nucleotide, how many nucleotides are identical (which have the exact same structure) in both DNA and RNA?
A- zero **B-** 2 **C-** 3 **D-** 4
- 47-**In complete dominance the trait of smooth seeds appears when its genotype is.....,but the trait of the terminal flower appears when its genotype is.....
A- only homozygous, only heterozygous **B-** only heterozygous, only homozygous
C- homozygous or heterozygous, only homozygous **D-** only heterozygous, homozygous or heterozygous
- 48-**In each replication fork there are:-
A- two helicases and one DNA polymerase **B-** one helicase and two DNA polymerases
C- one helicase and one DNA polymerase **D-** two helicases and two DNA polymerases
- 49-**Based on the adjacent table, that shows the ratio of nitrogen bases in humans, virus X, and wheat, which of the following choices is correct:
- | | Adenine(A) | Thymine(T) | Guanine(G) | Cytosine(C) |
|---------|------------|------------|------------|-------------|
| Human | 30.4 | 30.1 | 19.6 | 19.9 |
| X virus | 34.2 | 25.8 | 13.8 | 26.2 |
| Wheat | 27.3 | 27.1 | 22.7 | 22.8 |
- A-** DNA in X virus is single-stranded DNA
B- DNA in human, X virus, and wheat are in the form of a double helix. .
C- the ratio of purines to pyrimidines in human, X virus and wheat is 1:1.
D- all of them are correct
- 50-**Avery and his colleagues' experiments found that the cells.....unable to convert R cells into S cells.
A- missing DNA **B-** containing DNA **C-** missing protein **D-** missing RNA

Note: choose the correct answer:

(2 marks for each right answer)

1-In skeletal muscle the tissue that bounds together a group of fascicles is a(an): -

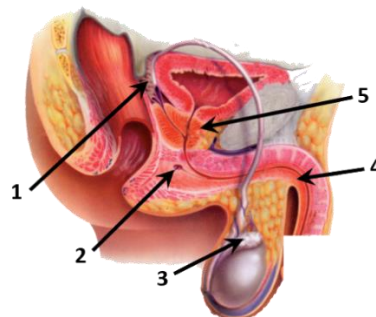

- A- epithelial tissues B- nervous tissue C- muscle tissue D- connective tissue

2-The cardiovascular system differs from the lymphatic system in that the cardiovascular system:

- A- is a part of the circulatory system B- contains red blood cells
C- its vessels are one-way that transport the fluid it contains from the tissues to the heart
D- contains lymphocytes

3-Which structures of the adjacent figure are **NOT** within the path taken by the sperm as they leave the body?

- A- 2, 3, 5
B- 2, 3, 4
C- 1, 2, 5
D- 1, 2, 4

4-Plasma cells: - A- secrete antibodies B- create holes in the membranes of the infected cells
C- make antibodies D- both (A and C) are correct

5-Which of the following is correct about red blood cells?

- A- immature red blood cells synthesize large amounts of hemoglobin
B- their cell nucleus and organelles disintegrate C- they form antibodies D- both (A and B) are correct

6-Which of the following directs most incoming sensory signals to the proper region of the cerebral cortex:

- A- midbrain B- medulla oblongata C- pons D- thalamus

7-Opportunistic infections: -

- A- can be considered as evidence that the HIV infection has progressed to AIDS
B- the organisms of these diseases usually do not create problems in people with a healthy immune system
C- appear in phase I of HIV infection D- both (A and B) are correct

8-Uterus contains target cells for which of the following hormones?

- A- estrogen B- progesterone C- oxytocin D- all of them are correct

9-The smooth muscle differs from the skeletal muscle in that the smooth muscle: -

- A- has origin and insertion points B- is striated C- forms the walls of the internal organs D- is voluntary

10-In the primary and secondary immune responses: -

- A- memory cells are produced B- antibodies are produced
C- antigens are attacked D- all of them are correct

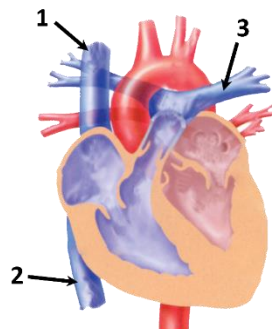

11-The similarity between the mechanism of action of amino acid-based hormones and the mechanism of action of thyroid hormones is that both mechanisms need to: -

- A- target cell B- second messenger C- bind to its own receptor D- both (A and C) are correct

12-Depending on the adjacent figure, all blood vessels

that are labeled by numbers 1, 2, 3: -

- A- are veins
B- carry deoxygenated blood to the heart
C- their walls are made up of three layers
D- both (A and C) are correct

13-Which of the following is **incorrect** for a relaxed muscle?

- A- the length of the actin and the myosin filaments does not change in comparison to a contracted muscle
B- the actin and myosin filaments overlap C- the actin and myosin filaments slide past each other
D- all of them are incorrect.

14-Which of the following does **NOT** occur during the first trimester of pregnancy?

- A- the legs, eyes, and ears have begun to develop B- the fetus can react to loud sounds.
C- fingers are formed. D- the heart begins to beat.

15-All of the following are correct about chemical receptors, **EXCEPT**:

- A- are neurons that detect stimuli B- are clustered in taste buds
C- are found in the mucous lining of the epithelium in the nasal passages
D-the action potentials they produce are interpreted only in the parietal lobe of the cerebral cortex

16-Which of the following is correct regarding the Schwann cell?

- A- transmits nerve impulses from the cell body towards the nerve endings
B- produces the myelin around the axon of neurons that are not found in the brain or in the spinal cord
C- receives stimuli from other neurons and transmits them towards the nerve endings
D- produces the myelin around the axon of all neurons

17- The adjacent figure shows which of the following?

- A- a Haversian canal that is surrounded by lamellae in compact bone.
B- a spongy bone that has a latticework structure.
C- a periosteum that contains a network of blood vessels.
D- a long bone cavity that contains the yellow bone marrow.

18-Which of the following is a function of the long bone:

- A- its ability to contract and relax enables the body to move B- produces platelets
C- helps the body to maintain a constant temperature D- all of them are correct

19-How many different genotypes can result from a dihybrid cross between two pea plants? If you know that one plant is a heterozygous of both traits and the other is unknown genotype, and that the ratio of heterozygous individuals for the two traits resulting from this cross is 25%.

- A- 2 B- 4 C- 8 D- all of them are incorrect

20-In the axial skeleton, the red bone marrow is found in the:-

- A- scapula B- clavicle C- sternum D- both (B and C) are correct

21-Which of the following is **incorrect**?

- (1- Only artery carries oxygenated blood, 2- The artery and the vein both have an inner layer of endothelial tissue, 3- The artery divides into smaller blood vessels until they end in capillaries, 4- Only vein carries deoxygenated blood).
A- 1, 3, 4 B- 1, 4 C- 1, 2, 4 D- 2, 3, 4

22-Both natural killer cells and inhibitory T cells

- A- are white blood cells. B- play a part in humoral immune response.
C- carry antigens of pathogen on their surfaces D- both (A and C) are correct

23-During inspiration, the diaphragm....., causing the air pressure inside the lungsthan the air pressure outside the body: -

- A- flattens, lower B- contracts, higher
C- relaxes, lower D- flattens, higher

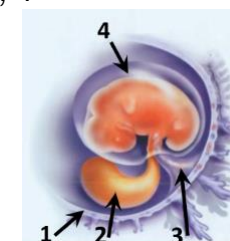

24-Which of the following are the characteristics of the atrioventricular node?

- (1- It is located in the septum between the two ventricles, 2- it relays the electrical impulse to the muscle cells that make up the ventricles, 3- it regulates the rate of contraction of the entire heart, 4- it initiates an electrical impulse and causes a QRS wave in the electrocardiograph(ECG))

- A- 1, 3, 4 B- 2, 4 C- 1, 2, 4 D- 2, 3, 4

25- In the adjacent figure, which number points to the membrane that surrounds all of the other embryonic membranes ?

- A- 1
B- 2
C- 3
D- 4

26-One of the following is secreted by a ductal gland:-

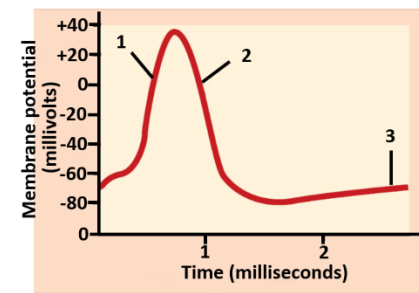

- A- aldosterone B- human chorionic gonadotropin C- cortisol D- lysozyme

27-Which of the following is correct regarding the Langerhans Islands?

- A- secrete two amino acid-based hormones that lower the blood sugar level
B- contain mostly exocrine cells C- function as an endocrine gland. D- all of them are correct

28- Which point on the graph represents when the voltage-gated sodium channels are open?

- A- only 1
- B- 1 and 3
- C- only 3
- D- 2 and 3

29- In phase II of HIV infection, all of the following occur **EXCEPT**:-

- A- the virus continues to replicate.
- B- helper T cells can no longer stimulate B cells.
- C- B cells continue to make a large amount of antibody against HIV
- D- The number of helper T cells drops steadily

30- In this blood transfusion process $AB^+ \longrightarrow O^-$:-

(1- anti-Rh antibodies will react with Rh antigens ,2- anti-A antibodies will react with A antigens, 3- anti-B antibodies will react with B antigens)

- A- 1 , 2
- B- 1 , 2 , 3,
- C- 1 , 3
- D- 2 , 3

31- When the, in the blood the sensors in the brain send a message to the respiratory muscles to return to a slower breathing rate.

- A- carbon dioxide concentration decreases
- B- carbon dioxide concentration increases
- C- the oxygen and carbon dioxide concentration increase
- D- the oxygen concentration decreases

32- The male reproductive system structure that lies between the bladder and the rectum, produces a fluid: -

- A- rich in sugars
- B- that neutralizes the acids in the female reproductive system
- C- that neutralizes traces of acidic urine in the urethra
- D- all of them are incorrect

33- In the process of hearing which of the following releases neurotransmitters?

- A- the hair cells
- B- the fluid inside the cochlea
- C- the membrane that covers the hair cells
- D- the bottom membrane of the middle chamber

34- What is the role of the follicle-stimulating hormone in humans?

- A- along with testosterone, stimulates sperm production
- B- stimulates the secretion of testosterone
- C- stimulates cell division in a follicle
- D- both (A and C) are correct

35- Which of the following often results in addiction?

- A- tolerance
- B- withdrawal
- C- dependence
- D- effective dose

36- Tobacco: -

- A- contains no substance that causes addiction
- B- causes chronic bronchitis
- C- burning of it produces tars that paralyzes the cilia that line the respiratory tracts
- D- both (B and C) are correct

37- Which of the following is correct regarding the cerebellum?

- A- it lies below and before the cerebral hemispheres
- B- the surface of cerebellum is highly folded
- C- It receives motor impulses coming from the ears
- D- all of them are correct

38- Epiphyseal plate is **NOT** found at the ends of immature: -.

- A- fibula bone
- B- skull bones
- C- humerus bone
- D- tibia bone

39- Which of the following pairs are correctly matched? A- macrophages : display antigens on its surface

- B- complement system proteins : are released by cells infected with virus
- C- stomach acids : are specific defenses
- D- thymus : helps produce all kinds of lymphocytes.

40- In which of the following states of the monohybrid crosses ,50% of the resulting individuals are recessive?

- A- If both parents are homozygous and dominant
- B- If one of the parents is recessive and the other is heterozygous
- C- If one of the parents is homozygous and dominant and the other is heterozygous
- D- If both parents are heterozygous

41- In complete dominance the trait of smooth seeds appears when its genotype is.....,but the trait of the terminal flower appears when its genotype is.....

- A- only homozygous, only heterozygous
- B- only heterozygous, only homozygous
- C- homozygous or heterozygous, only homozygous
- D- only heterozygous, homozygous or heterozygous

42- Which of the following represents the sequence that was used to transcribed this sequence (CUC AAG UGC UUC) of mRNA?

- A- CUCAAGUGCUUC
- B- GAGUUCACGAAG
- C- GAGTTCACGAAG
- D- AGACCTGTAGGA

43- Avery and his colleagues' experiments found that the cells.....unable to convert R cells into S cells.

- A- missing DNA
- B- containing DNA
- C- missing protein
- D- missing RNA

44- Based on the adjacent table, that shows the ratio

	Adenine(A)	Thymine(T)	Guanine(G)	Cytosine(C)
Human	30.4	30.1	19.6	19.9
X virus	34.2	25.8	13.8	26.2
Wheat	27.3	27.1	22.7	22.8

of nitrogen bases in humans, virus X, and wheat,

which of the following choices is correct:

- A- DNA in X virus is single-stranded DNA
- B- DNA in human, X virus, and wheat are in the form of a double helix. .
- C- the ratio of purines to pyrimidines in human, X virus and wheat is 1:1.
- D- all of them are correct

45- In the process of DNA replication: -

- A- the number of purines in one of the new strands is equal to the number of pyrimidines in the other new strand
- B- the number of pyrimidines in one of the new strands is equal to the number of pyrimidines in the other new strand
- C- each original strand serves as a template to make an identical strand as itself
- D- both (A and C) are correct

46- If the probability that a specific trait will appear in a generation is ($\frac{3}{16}$) and the number of individuals for this trait is (300) individuals, what is the total number of individuals in this generation?

- A- 300 individuals
- B- 800 individuals
- C- 1600 individuals
- D- 2400 individuals

47- Which of the following is **INCORRECT**?

- A- the codon AUG specifies the amino acid methionine in genetic code.
- B- the number of anti-codons is 61 anti-codons.
- C- the number of codons that specify amino acids is 61 codons
- D- the codon GCU, which specifies the amino acid alanine in genetic code, can specify another different amino acid

48- Considering the three components of a nucleotide, how many nucleotides are identical (which have the exact same structure) in both DNA and RNA?

- A- zero
- B- 2
- C- 3
- D- 4

49- In each replication fork there are:-

- A- two helicases and one DNA polymerase
- B- one helicase and two DNA polymerases
- C- one helicase and one DNA polymerase
- D- two helicases and two DNA polymerases

50- In which of the following crosses the ratio of genotype and the ratio of phenotype of the resulting individuals are equal?

- A- the cross between two heterozygous individuals in incomplete dominance
- B- monohybrid cross between two heterozygous individuals in complete dominance
- C- dihybrid cross between two homozygous individuals for both characteristics in complete dominance
- D- both (A and C) are correct
